

# Chapter 2 Alternatives

## Changes between the Draft EIS and Final EIS

The following changes were made to Chapter 2 between the Draft EIS and Final EIS.

Minor corrections, explanations, and edits are not included on this list.

- Figure 2.3-2 has been added to show the approximate number of fire-killed trees salvaged or retained by size class, as suggested by commenters.
- The “remaining area salvage” description in Alternative G has been changed to show that actual retained snags will be clumped. This reduced total salvageable acres.
- The description of proposed wildlife-related snag research has been updated in Alternative G.
- Salvage project design features in Section 2.3.1.3 have been reorganized for clarity, as suggested by commenters.
- Acres to be treated in the vegetation restoration projects in Section 2.3.2.2 for Late-Successional Forest Habitat Restoration, Pine Habitat Restoration, and Riparian Reserve thinning has been updated for Alternatives C, D, and G.
- Map 2-5 has been corrected. ‘Wildland Urban Interface’ areas on Map 2-5 in the DEIS should have been labeled ‘Communities at Risk.’ Map 2-5 in the FEIS displays the actual ‘Wildland Urban Interface’ areas.
- In Alternative G, tractor harvest acres have increased, while helicopter and cable system acres have decreased.
- Acreage figures and other numbers in alternative descriptions and Tables 2-1, 2-2, and 2-3 have been updated to reflect most current knowledge.
- Table 2-2 has been updated in the Insect Outbreak section to reflect the baseline used, which is Alternative A, No-Action.
- Table 2-4 “Stand Replacement Trends and Consequences” has been added to project future conditions at various snapshots in time for the stand-replacement fire areas, as suggested by commenters.
- Table 2-5 “Restoration Trends and Consequences” has been added, as suggested by commenters. It is an expansion of Table K-2.
- The following work has been completed and dropped from this EIS. This work was analyzed in the Timbered Rock Fire Emergency Stabilization/Rehabilitation Plan (ESRP) EA-OR-110-03-08.
  - Planting has been completed on approximately 1,000 acres within the fire
  - Removal of 1 fish culvert has been completed

# 2.0 Alternatives

- Seven alternatives were developed to respond to issues identified in Chapter 1.
- Alternatives address salvage within the fire perimeter and restoration projects throughout the LSR.
- A brief description of proposed salvage and restoration projects is included.
- Alternative G is the BLM's Preferred Alternative.
- A description of how alternatives were developed and the range of alternatives is included.
- Table 2-1 compares the alternatives in table format.
- Table 2-2 summarizes the effects of the alternatives.
- Table 2-3 summarizes cumulative effects.
- Table 2-4 projects the anticipated trends and consequences in stand-replacement areas.
- Table 2-5 projects the anticipated trends and consequences of the proposed restoration projects.

## 2.1 Introduction

Seven alternatives were developed to provide different responses to the issues identified in Chapter 1. A No Action Alternative (Alternative A) was included. Alternative G is identified as the BLM's Preferred Alternative.

The action alternatives contain two major categories of proposed projects:

1. Salvage within the fire perimeter (Alternatives C-G).
2. Restoration projects located throughout the Elk Creek Watershed (Alternatives B-G).

Maps illustrating the proposals by alternative are attached. Table 2-1 documents the salvage and restoration proposals by alternative in a comparative format. Table 2-2 is a comparison of the major effects that would occur if any of the alternatives were implemented. Table 2-3 summarizes the cumulative effects analyses presented in Chapter 3. Table 2-4 describes anticipated trends and consequences due to fire effects in salvaged and unsalvaged areas at 15, 50, and 80 years into the future. Table 2-5 describes anticipated trends and consequences of the restoration projects at 5 and 50 years in the future.

## 2.2 Alternative Design

The alternatives presented in this Final EIS were developed using an interdisciplinary process including managerial input.

Questions revolved around four major issues:

1. Should the BLM propose economic recovery of fire-killed trees (salvage) within the area affected by the Timbered Rock Fire?
2. If so, what level of salvage would be appropriate considering cumulative effects and land use allocations within the watershed?
3. If salvage is to be analyzed, why not evaluate restoration projects throughout the LSR?
4. What level of restoration is appropriate?

Preliminary review of the NFP, RMP, WA, and LSRA determined salvage is consistent with management direction or recommendations found in those documents. Subsequently, a decision was made to proceed with an analysis of salvage and to include late-successional forest restoration recommendations contained in the WA and LSRA. Cumulative effects would be analyzed in the environmental analysis.

A review of scientific literature, court decisions, management direction/recommendations, discussions among team members, and comments from the public revealed that levels of snags and coarse woody debris (CWD) were critical issues regarding salvage and management of LSRs. The interdisciplinary team decided to formulate salvage alternatives around these concerns which also had a direct effect on recoverability of fire-killed trees. Projects designed to restore late-successional forest conditions would be developed from recommendations in the previously prepared WA or LSRA or developed during preparation of this EIS.

## 2.3 Proposed Project Descriptions

### Project Proposals

#### Salvage

- Area Salvage
- Salvage Research Proposal
- Roadside Salvage

#### Restoration

- Fish Habitat Improvement
- Culvert Replacement
- Fish Structures
- Vegetation Treatments
- Late-Successional Habitat Restoration
- Pine Habitat Restoration
- Riparian Habitat Restoration
- Oak Woodland and Meadow Restoration
- Reforestation
- Reforestation Research Proposal
- Fuels Treatments
- Fuel Management Zones
- Fuel Hazard Reduction
- Wildlife Projects
- Eagle Habitat Improvement
- Denning Habitat Project
- Road Projects
- Road Reconstruction
- Road Stream-crossing Upgrades
- Road Maintenance
- Road Decommissioning
- Seasonal Road Closures
- Pump Chance Reconstruction
- Rock Quarry Closure and Rehabilitation

Following is a brief description of proposed projects. Salvage is described in Appendix D. Restoration projects are described in Appendix E. Project locations are shown on project maps and on alternative maps.

### 2.3.1 Salvage Proposals

Two types of salvage, area and roadside, are discussed. Alternatives A and B propose no salvage. Salvage within Alternatives C - G would obtain some level of economic recovery. Each salvage alternative was designed using specific guidance relating to post-fire salvage and/or Late-Successional Reserve guidelines. Description of this guidance is included in the alternative descriptions. Research could be considered within each of the salvage alternatives. Alternative G includes a research proposal designed specifically to study the effects of various snag retention levels on wildlife species.

Acres of salvage vary by alternative and an array of snag and coarse woody debris (CWD) levels are considered. Harvest methods vary within each alternative. Treated acres and harvest method acres are provided within each alternative description.

The salvage proposal would not include harvesting of green trees but an occasional green tree may be cut to facilitate logging. These trees may be needed for guy lines for cable yarding systems, yarding corridors, landings, and new temporary road construction. These trees would be harvested. Any green trees cut in Riparian Reserves or within one-quarter mile of active owl sites would be left for CWD.

It is anticipated most fire-killed trees in 8-16" DBH size classes would deteriorate before any salvage would occur and would no longer have commercial value. These trees would provide additional snags and CWD.

Salvage of roadside hazard trees is included in all salvage alternatives (Alternatives C–G). The goal is to recover the economic value of trees that have been identified as hazards to users within the fire area. Regardless of the alternative, trees identified as hazards would be felled.

#### 2.3.1.1 Area Salvage

Table 2.3-1 shows how the fire-killed trees are distributed across the Timbered Rock Fire area. Scattered areas within the fire perimeter were unburned.

Area salvage is proposed on BLM-administered lands within

**Table 2.3-1. Acres of Fire-killed Trees**

Acres of stand-replacement in riparian	656
Acres of stand-replacement in areas <10 acres in size	551
Acres of all other stand replacement	1,379
Total acres of stand replacement	2,586
Low severity burn areas; >40% canopy cover	7,206
Total acres of fire-killed trees	9,792

the Timbered Rock Fire perimeter where trees were killed by the fire. Only trees considered dead would be salvaged. As used in this EIS, a fire-killed tree is defined as “a tree with no apparent sign of green foliage.” The location and amount of salvage being considered varies by alternative. Harvest systems in all alternatives would include tractor, cable, and helicopter logging.

In Alternatives A and B, no salvage would occur. Alternatives C, D, and G focus on high and moderate burn

severity areas greater than 10 acres and less than 40 percent canopy cover where the fire resulted in a stand-replacement event. Alternative C is based on guidelines from the LSRA including snag and CWD retention recommendations.

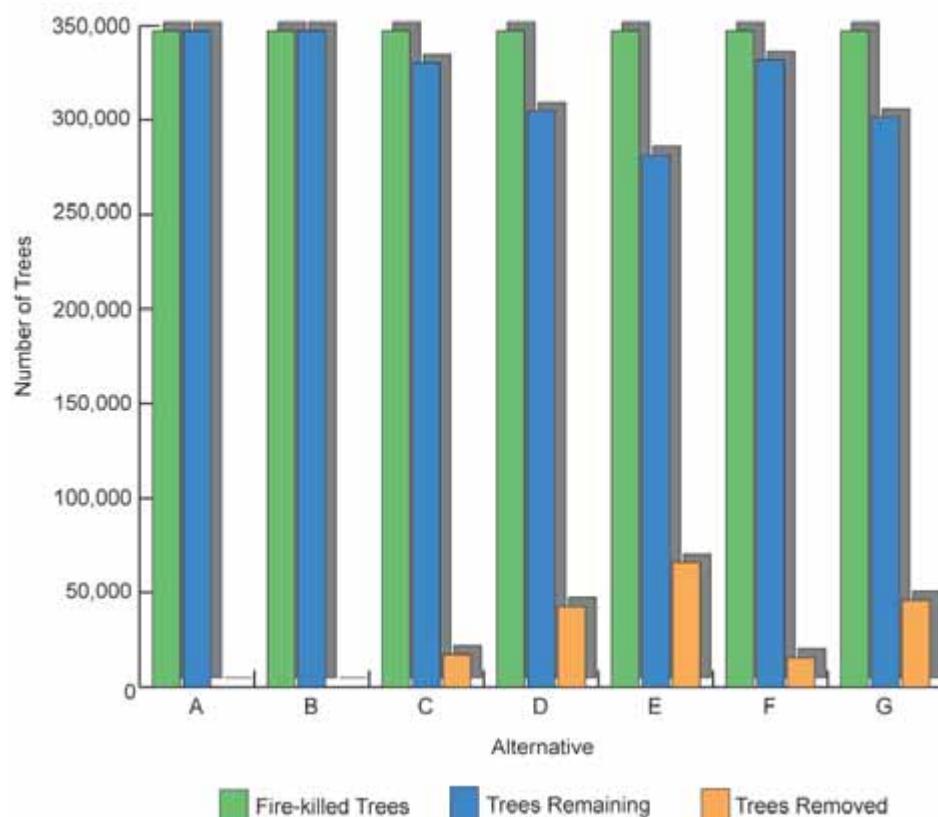

Alternative D follows the guidelines from the NFP (USDA and USDI 1994, C-14). Snag and CWD retention levels in this alternative were based on the DecAID Advisor developed by the LSR Working Group (see Appendix D). Alternative G includes a salvage research proposal and area salvage proposal. Snag and CWD retention levels in the research units would meet levels recommended in the research proposal. Snag and CWD retention levels in the area salvage would meet levels recommended in a variety of local and regional sources.

Alternative E considers high, moderate, low, and very low burn severity areas for salvage. Snag retention levels within the high and moderate burn severity areas for this alternative would be 6-14 snags per acre, based on a study of the *Effects of Stand-Replacement Fire and Salvage Logging on a Cavity-Nesting Bird Community in Eastern Cascades, Washington* (Haggard and Gaines 2001). The study found the highest diversity in cavity nesting species and highest number of nests in areas where snag densities ranged from 6-14 snags per acre. Snag retention within the low and very low burn severity areas would be four snags per acre. The CWD level in this alternative would be 120 linear feet per acre, with a minimum size of 16" by 16".

In Alternative F, the emphasis is on implementing guidance contained in *Recommendations for Ecologically Sound Post- Fire Salvage Management and Other Post-Fire Treatments on Federal Lands in the West* (Beschta, et al. 1995). Emphasis would be placed on recommendations to avoid severely burned areas, erosive sites, fragile soils, riparian areas, steep slopes, or sites where accelerated erosion is possible. Other recommendations from this paper were considered but were not included (see Section 2.5.1.3 - Alternatives Considered but Eliminated from Detailed Analysis). Existing snags and CWD levels would be retained on all these areas. Salvage would occur in patches of fire-killed trees between 3 and 10 acres in size. Within each of these patches, a minimum of two acres would be reserved from salvage.

Alternative G includes a design to investigate the influences of post-fire salvage and salvage intensity on wildlife response. This alternative was designed in collaboration with Oregon State University scientists and the Cooperative Forest Ecosystem Research (CFER) group. For this study, 12, 30-acre or greater units were selected. The objective for this study is to determine the relative influence of salvage on wildlife species.

**Figure 2.3-1. Distribution of All Fire-killed Trees**

## Chapter 2-Alternatives

Three treatments will be implemented in the study:

### 1. Control

No salvage activity would occur.

### 2. Moderate Salvage Prescription

No salvage would occur in 30 percent of the site. In the remaining 70 percent of the site, 6 trees per acre greater than 20" DBH would be retained on all sites. The unsalvaged area would include riparian areas, if present. Retained snags would be dispersed throughout the salvaged area

### 3. Heavy Salvage Prescription

The entire site would be salvaged. Six trees per acre greater than 20" DBH would be retained throughout the site. Retained snags would be dispersed throughout the salvaged area.

In the salvaged research units, all management activities, such as reforestation, would be identical across treatments.

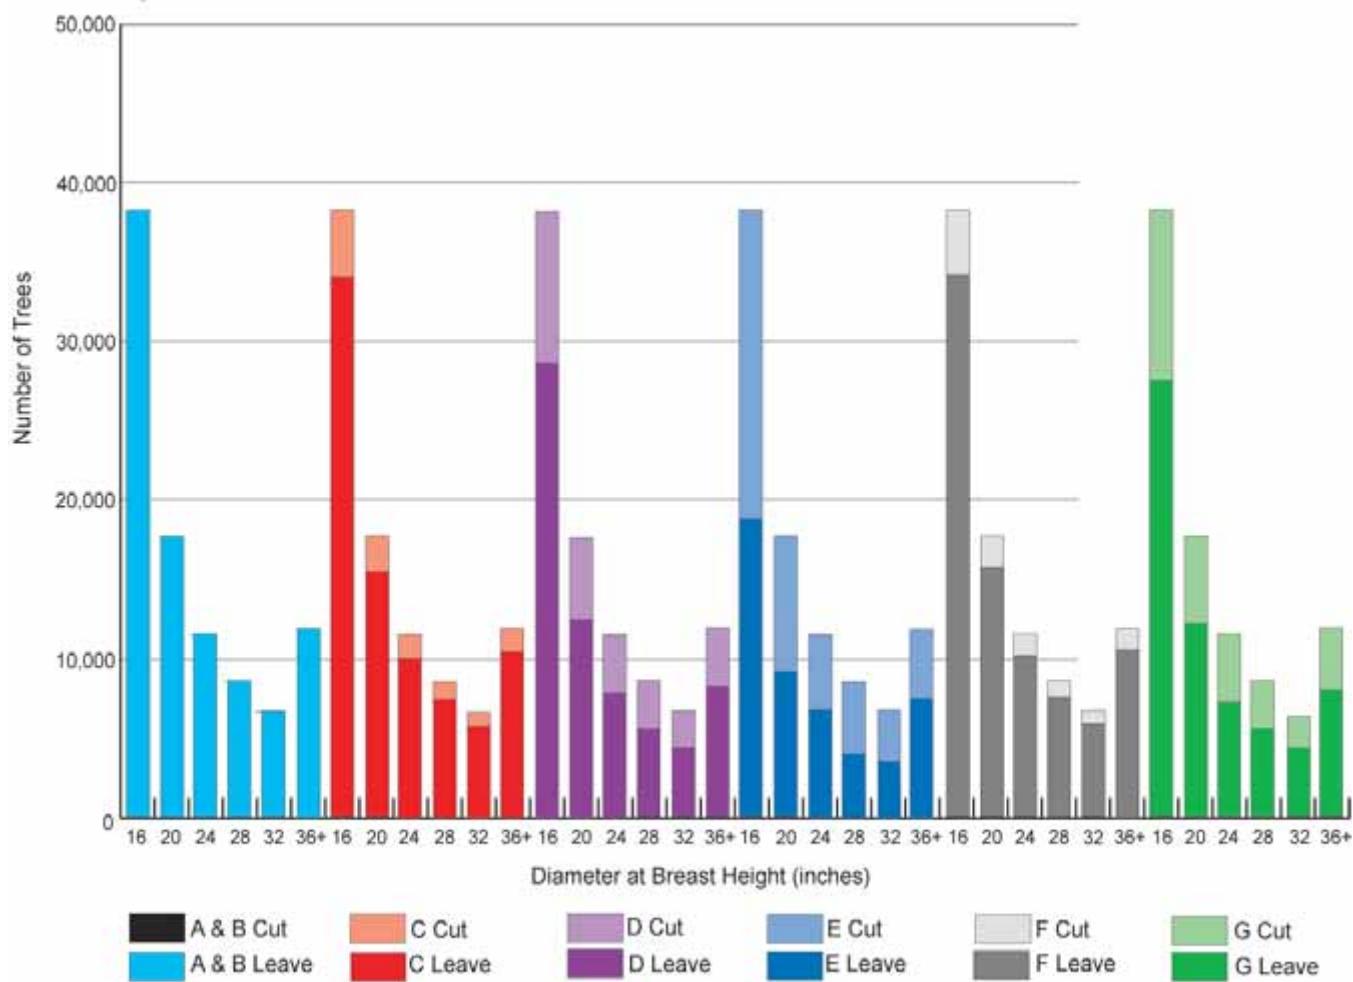

These research proposals are further described in the project descriptions with the complete study plans found in Appendix G.

In areas other than the salvage research units, salvage areas could occur in high and moderate severity areas greater than 10 acres. Snag retention in these units would follow recommendations from a number of local and regional references (see Appendix D). Salvage could occur in areas less than 10 acres in size for operation purposes and where adjacent to FMZs. Snags would be retained in reserved areas outside of cut patches.

Figure 2.3-1 illustrates the number of fire-killed trees which would be retained and/or salvaged by alternative.

Figure 2.3-2 illustrates the number of fire-killed trees by diameter which would be retained and/or salvaged by alternative.

**Figure 2.3-2. Distribution of Salvaged and Retained Fire-Killed Trees by Alternative and Diameter Class**

Trees 8" and 12" DBH not included in graph. They are not expected to be salvaged because of merchantability.

This graph is intended for comparison purposes only. The numbers are approximations based on stand exam information.

**Table 2.3-2. Acres of Available Roadside Salvage by Burn Severity**

Burn Severity	Alternative C	Alternative D	Alternative E	Alternative F	Alternative G
High/Moderate	127	136	54	233	74
Low/Very Low	951	950	482	949	881
Total	1,078	1,086	536	1,182	955

Appendix D contains visual depictions of how one proposed harvest unit (located in T32S, R1E, Section 29) would look after salvage in each alternative. These visual depictions were generated using the Stand Visualization System (SVS), a computer-based program. Figure D-2 in Appendix D illustrates what the stand would look like in Alternatives A, B, and F where no salvage would occur. Figures D-3, D-4, and D-5 show the same stand following salvage guidelines under Alternatives C, D, and E respectively. Salvage in the proposed harvest unit under Alternative G is shown in a series of three figures. Figure D-6 illustrates how the unit would look following salvage based on guidelines from an intensive salvage research unit, Figure D-7 is based on moderate salvage research unit guidelines, and Figure D-8 shows remaining area salvage.

### 2.3.1.2 Salvage of Roadside Hazards

Table 2.3-2 shows the approximate acres of roadside salvage by burn severity within each alternative.

Roadside salvage along BLM-administered roads is proposed in Alternatives C-G. The intent is to capture the economic value of the fire-killed trees which are or could be a hazard to road users, including the public, government employees, private landowners, and contractors. This would include salvaging of hazard trees previously felled along the Pacific Power powerline in T32S, R1E, Section 5. Trees felled within riparian areas or needed in log piles for wildlife habitat would be excluded from salvage.

The area considered for roadside salvage is generally a 200' strip above and below existing open roads or roads needed on a temporary basis for post-fire operations. Not all trees within this 200' strip are hazards and therefore would not be salvaged; only those trees which pose a threat or potential threat would be harvested. Guidance from the Occupational Safety and Health Administration (OSHA) would be considered to determine hazard trees. Roadside hazards would vary by location along the road and burn severity. Areas below the road would have fewer hazard trees than areas above the road. Stand replacement areas (generally high and moderate severity) would have higher concentrations of hazard trees. Areas of low and very low severity would have fewer hazard trees and would be isolated trees scattered along the roads.

The BLM would only identify immediate hazard trees along roads through riparian areas or in owl activity centers with suitable habitat. Hazard trees identified in these areas would be cut. Only the tree or portion of tree which falls within the road

prism, from the top of the road cut to the top of the fill, would be salvaged.

### 2.3.1.3 Salvage Project Design Features

The following Project Design Features (PDF) are included in the design of salvage projects in Alternatives C-G. These PDFs are a compilation of the Best Management Practices identified in the Medford District RMP and resource protection measures identified by the EIS ID Team. The PDFs would serve as a basis for resource protection in the implementation of any salvage actions. They will be considered in the analysis of the impacts of salvage in the Chapter 3. Project Design Features for restoration projection are included in each project description.

1. The total number of skid trails would be minimized by designating skid trails with an average of 150' spacing. Avoid creating new skid trails and utilize existing trails where feasible in order to minimize ground disturbance, especially in thinning and selective cut units where no ripping is proposed. Design skid trails to minimize disturbance.
2. Skid trails would be located to minimize disturbance to coarse woody debris (CWD). Where skid roads encounter large CWD, a section of the CWD would be bucked out for equipment access. The remainder of the CWD would be left in place and not disturbed.
3. Tractor and/or mechanical operations would be restricted to slopes generally less than 35 percent.
4. Skid trails would be water-barred during the same operating season as constructed.
5. Ripping of skid trails would occur in all tractor yarded salvage units during the same operational season they were constructed. No ripping would occur within 100 feet of any existing green trees greater than 7" DBH.
6. All tractor yarding, soil ripping, and excavator piling operations would be limited to the dry season, generally from May 15 to October 15, and/or when soil moisture is less than 25 percent.
7. Areas identified for ripping (skid roads, landings, decommissioned roads) would be ripped to a depth of 18" utilizing a sub-soiler or winged toothed rippers.

## *Chapter 2-Alternatives*

8. Cable yarding would require one-end suspension, full suspension over streams, and no streambank disturbance.
9. Hand water bar corridors in roadside salvage areas above roads where drainage would lead directly to streams.
10. Water bar all yarding corridors within Riparian Reserves.
11. Water bar yarding corridors where needed, as determined by the contract administrator.
12. Along the ridgetops in the FMZs, where large diameter snags are present and salvage logging is proposed to reduce risk, retain 2 stumps per acre >30" DBH and 30-36" high to provide habitat for bats on ridges, where it can be safely accomplished.
13. Activity slash would be lopped and scattered, piled, or burned as necessary to reduce or eliminate additional fuel loading. Piled slash would be burned during the fall and winter to reduce impacts on air quality. All burning would follow the guidelines of the Oregon Smoke Management Plan.
14. Harvest would be restricted from March 1 to September 30 within ¼ mile of known spotted owl sites (within ½ mile for helicopter operations). This restriction may be waived if non-nesting is determined. If any new owls were discovered in harvest units following the sale date, activities would be suspended until mitigation could be determined.
15. Harvest would be restricted from March 1 to September 30 within ¼ mile of known spotted owl sites (within ½ mile for helicopter operations) in any unsurveyed green stand determined to be suitable as northern spotted owl nesting habitat. This restriction may be waived if non-nesting is determined.
16. Activities would be restricted from February 1 to August 1 within ½ mile of suitable, unsurveyed peregrine falcon nest cliffs (within 1 mile for helicopter operations).
17. Activities would be restricted from March 1 to August 1 within ¼ mile of newly discovered great gray owl nests or within unsurveyed, suitable great gray owl habitat.
18. Surveys would be conducted prior to any activity that could alter habitat for Survey and Manage mollusk and red tree vole species. Sites would be protected consistent with current management guidelines.
19. Activities would be restricted from March 1 to July 15 within suitable unsurveyed goshawk habitat.
20. Special Status and Survey and Manage vascular plant, lichen, bryophyte, and fungi sites that require protection would be buffered. Buffer sizes would be determined based on species, proposed treatment, site-specific environmental conditions, and management recommendations.
21. Mitigation measures and buffers would be applied, as needed, to avoid disturbance to known archeological sites. .
22. Cultural resources discovered during project implementation would be reported to the authorized officers and protected until properly evaluated.
23. All road renovation, decommissioning, and/or improvement work would be limited to the dry season, generally from May 15 to October 15, or when soil moisture is less than 25 percent.
24. Dust abatement materials, such as lignin, Mag-Chloride, and/or approved petroleum based dust abatement products, would not be applied during or just before wet weather and at stream crossings or other locations that could result in direct delivery to a water body (typically not within 25' of a water body or stream channel).
25. Selected roads would be blocked and barricaded after use and before the beginning of rainy season (generally October 15).
26. When removing a culvert, slopes would be pulled back to the natural slope or at least 1:1.5 to minimize sloughing, erosion, and potential for the stream to undercut streambanks during periods of high streamflows. Stream channels would be restored to bank full width and natural grade.
27. Roads identified for decommissioning would be seeded with native seed and mulched in the same operational season they are decommissioned.
28. Temporary roads constructed for harvest operations would be decommissioned within the same operating season they are constructed.
29. Equipment would be free of weed reproductive plant parts prior to moving into the management area.
30. Divert the stream around the work area in a manner (e.g. pipe or lined ditch) that would minimize stream sedimentation. Contractor would submit a water diversion plan for approval prior to stream work. To reduce movement of sediment downstream from the project site, the use of straw bales, geotextile fabric, or coconut fiber logs/bales immediately downstream of the work area would be required.
31. Location of waste stockpile and borrow sites resulting from road construction or reconstruction would be at least one site potential tree length from a stream where sediment-laden runoff could be confined.
32. Soil disturbed during road work or culvert replacement would be seeded with native grass seed after completion of work, using appropriate native species.
33. Seed, feed grains, forage, straw, and mulch would be free of weed reproductive plant parts, as per the North American Weed Free Forage Certification Standards.

34. Apply native grass seed on landings and tractor skid trails within 50-feet of existing roads. Apply native grass seed on all helicopter landings. Use appropriate native species.
35. A Spill Prevention, Control, and Countermeasure Plan (SPCC) would be required prior to operation and would include, but not be limited to, identification of hazardous substances to be used in the project area and identification of purchasers' representatives responsible for supervising initial containment action for releases and subsequent cleanup.
36. Refueling of equipment would take place outside of the Riparian Reserves.
37. All hazardous materials and petroleum products would be stored in durable containers outside Riparian Reserves so that any accidental spills would be contained and not drain into the stream system.
38. Appropriate mitigation measures would be applied to ensure that fluids or hazardous materials from heavy equipment operations do not enter stream channels.

### **2.3.2 Restoration Proposals**

Restoration projects are proposed in the action alternatives, Alternatives B-G. Alternative A (No Action) has no restoration projects proposed, but rehabilitation and stabilization projects proposed in the Timbered Rock Fire Emergency Stabilization Rehabilitation Plan Environmental Assessment (ESRP) would be implemented.

Four levels of restoration projects are proposed in the six action alternatives: focused, moderate, extensive, and focused within the fire perimeter. The alternatives vary by the scope of the projects (acres, miles of roads, etc.), intensity of the treatments, and location of the treatments. Restoration projects are located both within the Timbered Rock Fire perimeter and outside the fire area. Most projects are located within the Elk Creek Watershed; however, a proposed eagle nest project and some fuel management zone (FMZ) projects are located on a ridge top within adjacent watersheds. Projects are based on recommendations presented in the LSRA and/or Elk Creek WA, or were developed to address specific issues. Projects are designed to meet the objectives described in Section 1.3.1.

Projects proposed within the fire area focus on road projects to reduce existing and potential erosion from the road network, fish habitat improvement projects, development of Fuel Management Zones (FMZ), and reducing future hazardous fuel conditions within existing Northern Spotted Owl activity centers. Reforestation of the burned area was assessed in the ESRP EA. Alternatives A and E follow those recommendations. Other approaches to reforestation are presented in Alternatives B, C, D, F, and G. A reforestation study is included which would evaluate a variety of planting

*Restoration Proposals*

densities, species, and follow-up treatments in both salvage and unsalvaged areas. This reforestation research could be incorporated into any alternative. These research proposals are further described in the project descriptions with the complete study plans found in Appendix G.

Summaries of proposed restoration projects are presented below. See Appendix E for more detailed descriptions.

#### **2.3.2.1 Fish Habitat Improvement Projects (see Map 2-1)**

##### **Project Objectives**

To improve habitat complexity and passage on BLM-administered land for salmon and trout and to improve shade and future large wood recruitment in the first 160' from the stream.

##### **Desired Future Conditions**

Improved passage through culverts; logs almost parallel to the stream; rock weirs and logs to provide spawning gravel retention and rearing habitat; and trees reestablished in the Riparian Reserve to improve shade and future large wood recruitment to the stream.

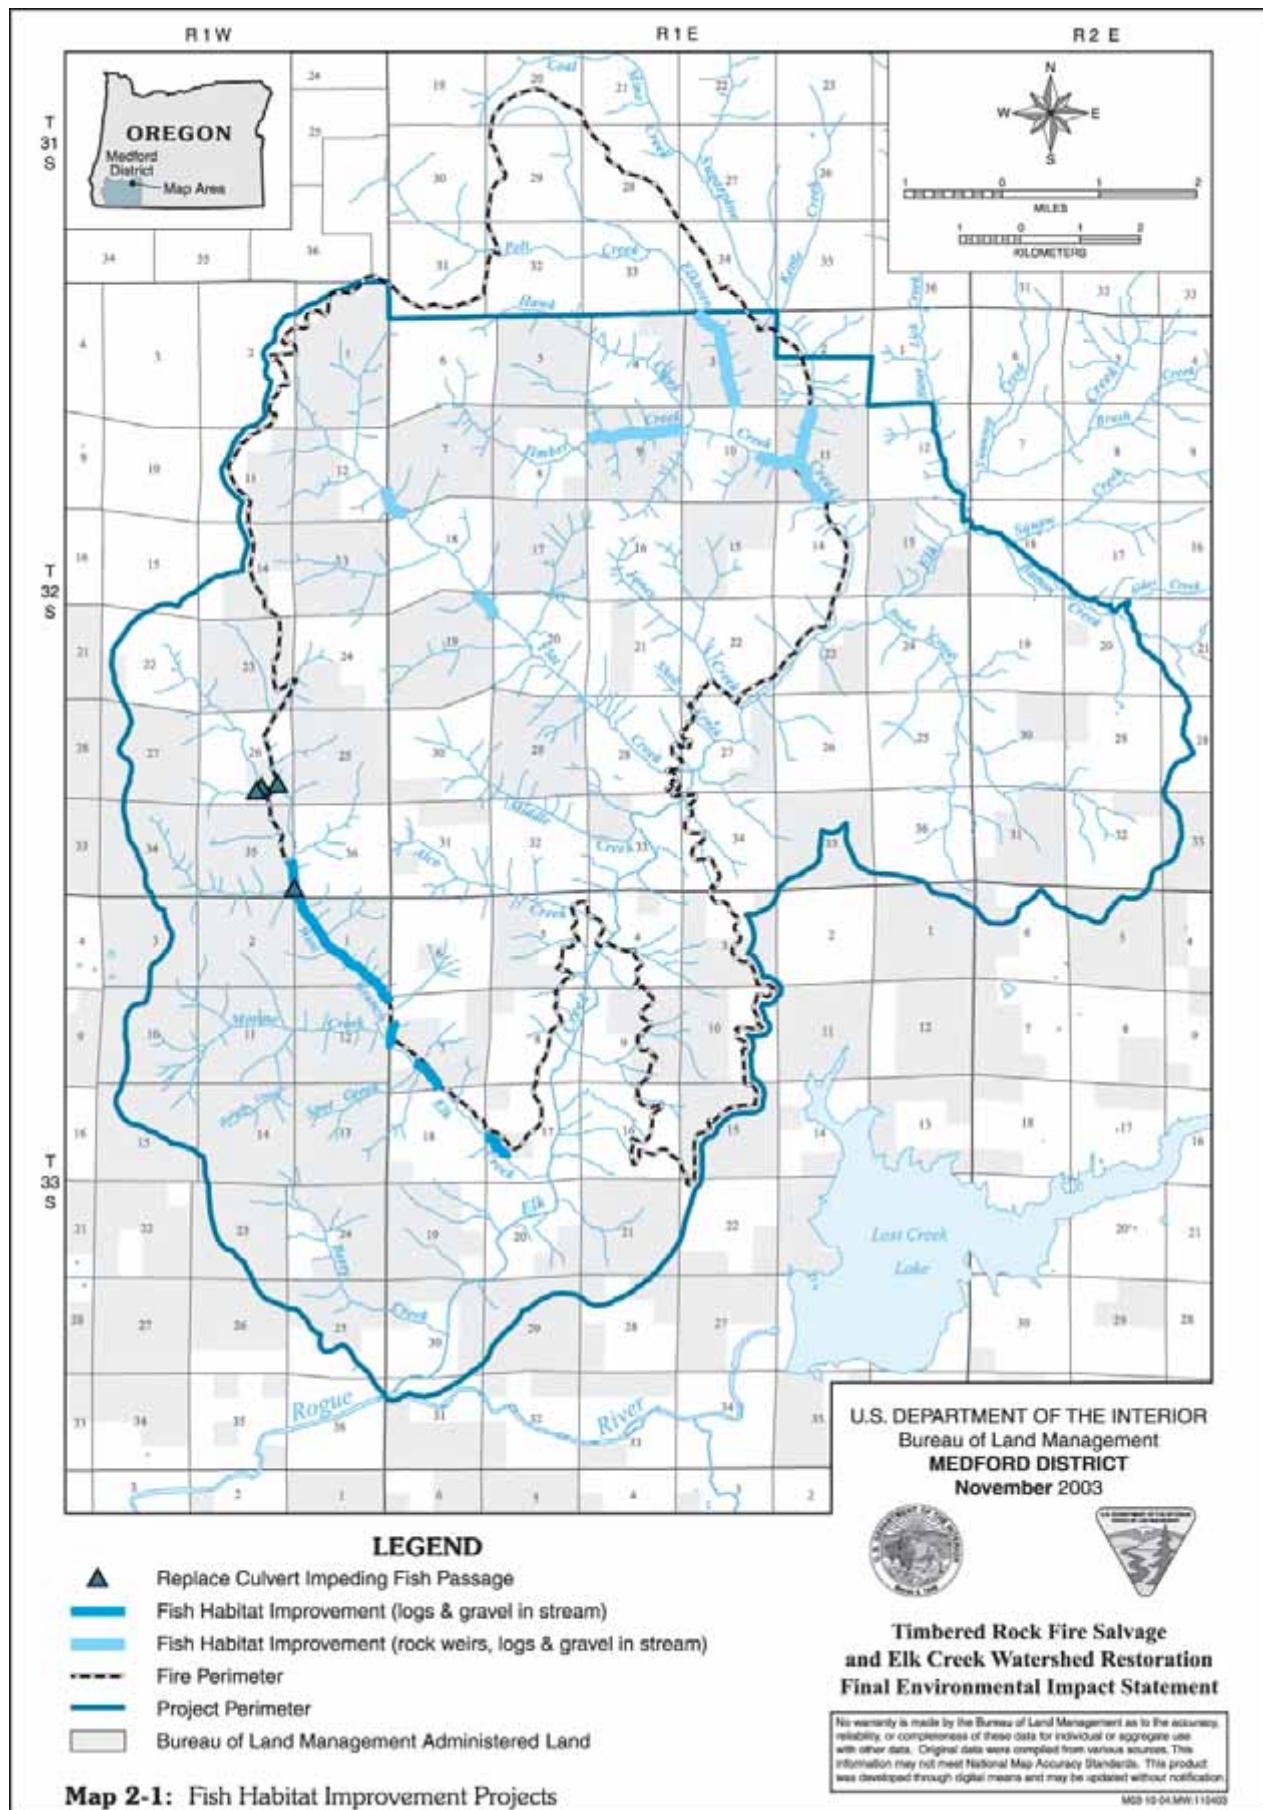

##### **Project Design Features**

Replacement of four culverts for trout and potential coho passage would open five miles of habitat. The use of rock weirs would aid in collecting gravels for spawning and create plunge pools for rearing. Rock weirs would vary from 3 weirs per mile to 10 weirs per mile. Up to 40 cubic yards of gravel would be placed above rock weirs where possible.

Where accessible, large wood (20-24" DBH) would be placed almost parallel to the streambank for adult holding cover. Log placement would vary from 15 logs per mile to 25 logs per mile. Smaller diameter trees would be taken from riparian reserve thinnings and added to the stream where appropriate. As part of the riparian thinning restoration plan, trees 10 to 80 years old would be felled within 160' of the stream for instream habitat, provided 50 percent canopy is retained. Fifteen logs per mile is based on the Klamath Province and twenty-five logs per mile is based on a mix of Klamath and Cascade Province recommendations (Shatford 2002, 23-24).

Smaller diameter trees would be taken from Riparian Reserve thinnings and added to the stream where appropriate. As part of the riparian thinning restoration plan, trees 10 to 80 years old would be thinned from 30-160 feet from stream channel, provided at least 40 percent canopy cover is retained.

Instream projects would include the use of an excavator. Any temporary skid trails needed to access the stream would be water-barred and seeded. The excavator would make a 12-foot wide path from the road to the stream, with no

more than ten passes on the path. No blading on the path would occur. Other resources in conflict with the designated sites would be mitigated with a buffer. Equipment would avoid archeological and botanical sites. West Branch Elk Creek includes existing logs from the fire with little supplementation needed of off-site logs. Equipment would avoid archeological and botanical sites.

### 2.3.2.2 Vegetation Restoration Projects (see Map 2-2)

#### Late-Successional Forest Habitat Restoration

##### Project Objectives

Accelerate the growth of trees in stands to promote late-successional conditions with a variety of size classes. Maintain species diversity to promote connectivity between owl activity sites and develop late-successional forest characteristics.

##### Desired Future Conditions

Suitable spotted owl habitat for nesting, roosting, and foraging composed of mature timber stands. Stands contain large conifers (21" DBH or greater), multi-layered structure, and 60 percent or greater canopy closure (USDA and USDI 2001, I-2, 3). Understory should be open between shrub layer and mid-canopy for flight paths. Nest sites include cavities 50 or more feet above the ground in large decadent old growth conifers, large mistletoe clumps, old raptor nests, and platforms formed by whorls of large branches.

##### Project Design Features

Stands of trees less than 8" DBH (10-29 years old) would be pre-commercially thinned (PCT) to accelerate the growth of reserve trees. Stands of trees greater than 8" DBH (30-80 years old) would be commercially thinned to increase growth on residual trees, retain and promote large branches on select trees, promote the development of variable tree sizes in the residual stand, and retain the variety of species present.

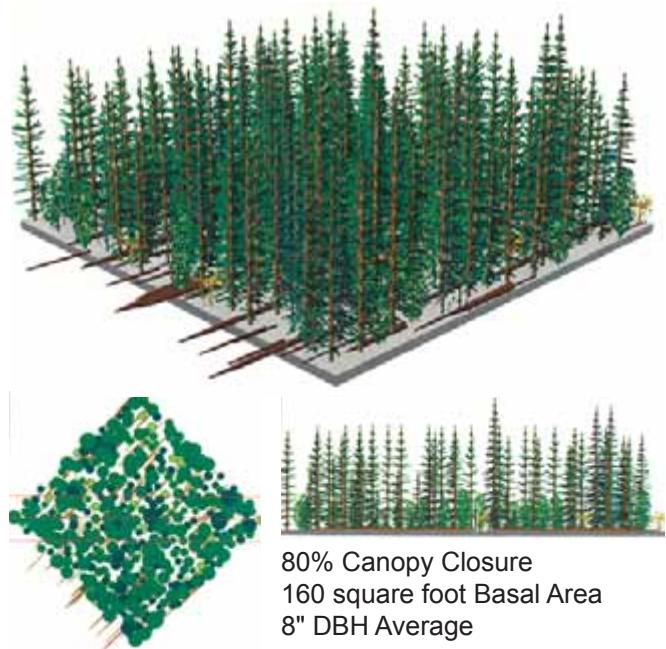

##### Condition 1: Young conifer plantations generally 10 to 30 years old.

These stands are comprised of conifers of similar size. Thin conifers to a spacing range of 12-15' to increase growth rates, yet allow for crown closure within 10-20 years. This would promote natural shading, mortality, and removal of lower limbs. Retain unthinned patches up to one-half acre in size for every 10 acres thinned. Retain up to 25 percent canopy component in hardwoods. Select up to 25 trees per acre and remove all surrounding vegetation for approximately 5' beyond the dripline. This would increase growth rates and retain limbs to allow for future large branches as these trees mature and become dominant in the overstory. Pile and burn slash from operations.

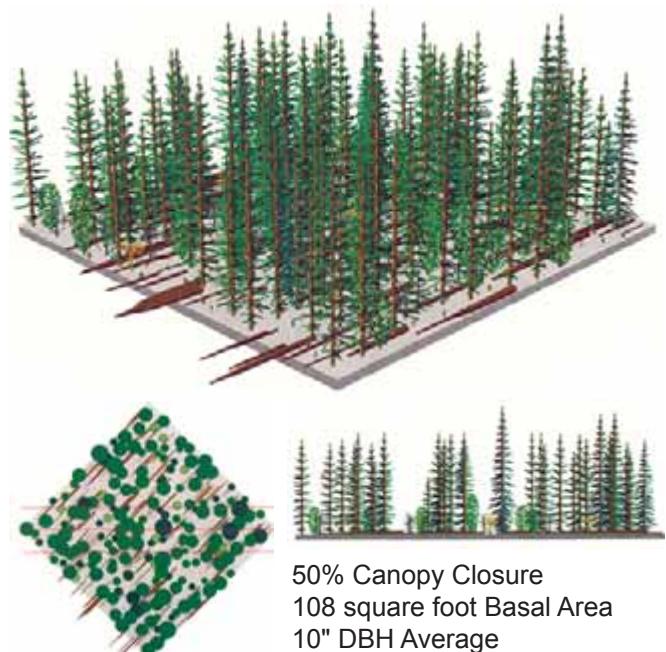

##### Condition 2: Young stands with mixed age and size classes, scattered overstory conifers.

These stands also have variable densities of conifers and hardwoods. In areas where predominant conifer size is less than 3" DBH, thin to a spacing of 12-15'. Areas where the predominant conifer size is 3-8" DBH, thin to a spacing of 15-20'. Retain unthinned patches up to one-half acre in size

**Figure 2.3-3. Proposed Late-Successional Forest Habitat Restoration Project – Before Thinning**

**Figure 2.3-4. Proposed Late-Successional Forest Habitat Restoration Project – After Thinning**

## *Chapter 2-Alternatives*

for every 10 acres thinned. Retain hardwood trees unless they constitute greater than 25 percent of the canopy. Reduce hardwood component to 25 percent of canopy in stand being treated. Pile and burn slash from operations.

### **Condition 3: Stands dominated by conifers in age classes from 30 to 80 years old.**

Conifer and hardwood densities and size classes are variable. Stands would be thinned to a basal area range of 120-140' per acre of total overstory basal area, retaining a minimum of 50 percent canopy closure in stand. Retain unthinned patches up to one-half acre in size for every 10 acres thinned. Retain up to 25 percent of canopy component in hardwoods. Reserve trees would be a mix of species present. Variable spacing and reserving both dominant and codominant tree sizes is preferred over even-spacing and even-size distribution of reserve trees. Pile and burn slash from operations.

Figures 2.3-3 and 2.3-4 are computer representations of a typical stand planned for late-successional restoration thinning, showing the stand before and after treatment. These figures were developed using a stand visualization system from stand exam data collected in actual units proposed for treatment.

## **Pine Habitat Restoration**

### **Project Objectives**

Promote pine species regeneration in areas historically inhabited by pines, retaining existing dominant pine in the overstory. Promote pine dominance in stands historically dominated by pines but presently dominated by Douglas-fir and other species.

### **Desired Future Conditions**

Ponderosa and sugar pines dominant in the overstory up to 23 trees per acre (tpa) with a codominant component of pines (<20" DBH) up to 40 tpa. An understory of conifers dominated by pines (<12" DBH) with less than 80 tpa (USDA and USDI 1998, 179). Mix of conifers in the overstory, including Douglas-fir and incense cedar and a component of hardwoods in mid-canopy and understory including madrone and chinquapin.

### **Project Design Features**

Stands with ponderosa or sugar pine present in overstory or understory, or historic presence of pine in overstory would be thinned to promote pine retention and growth. Large overstory pines would have non-pine vegetation in understory removed to promote pine regeneration. Stands with pine less than 80 years old would be thinned to retain pine and promote growth of existing pine in stand.

- Stands with large (>20" DBH and >80 years old) overstory ponderosa or sugar pines present.**

In areas where pine are not present in the understory, clear around large (>24" DBH) overstory pines for up to 20' beyond dripline to promote pine regeneration. Trees up to

24" may be removed (USDA and USDI 1998, 165). When large overstory trees are within 50' of each other, only one of those trees would receive understory clearing.

Beyond the clearing area, pre-commercial thin (14-20 foot spacing) understory stands (<8" DBH) presently consisting of Douglas-fir, white fir, incense cedar, ponderosa and sugar pine, madrone, and chinquapin to favor dominance of pine species as residual stand.

Beyond the clearing area, commercial thin understory stands (>8" DBH) retaining 100-180 square feet of total basal area retaining the same species preference for pine. Only trees less than 80 years old would be removed. These would generally be less than 18" DBH.

- Stands with sugar and ponderosa pines present in overstory predominantly less than 18" DBH (30-80 years old).**

Commercially thin these stands favoring all healthy pines for reserve trees retaining 100-180 square feet of total basal area (USDA and USDI 1998, 190).

- Young stands less than 8" DBH with pine present and without pine in the overstory, but with historic presence of pine in the overstory.**

Pre-commercially thin (14-20 foot spacing) stands presently consisting of Douglas-fir, white fir, incense cedar, ponderosa and sugar pine, madrone, and chinquapin to favor dominance of pine species as residual stand. Retain unthinned patches up to one-half acre in size for every 10 acres thinned

Introduce prescribed fire into the understory after reducing initial fuel loadings through piling and burning of piles.

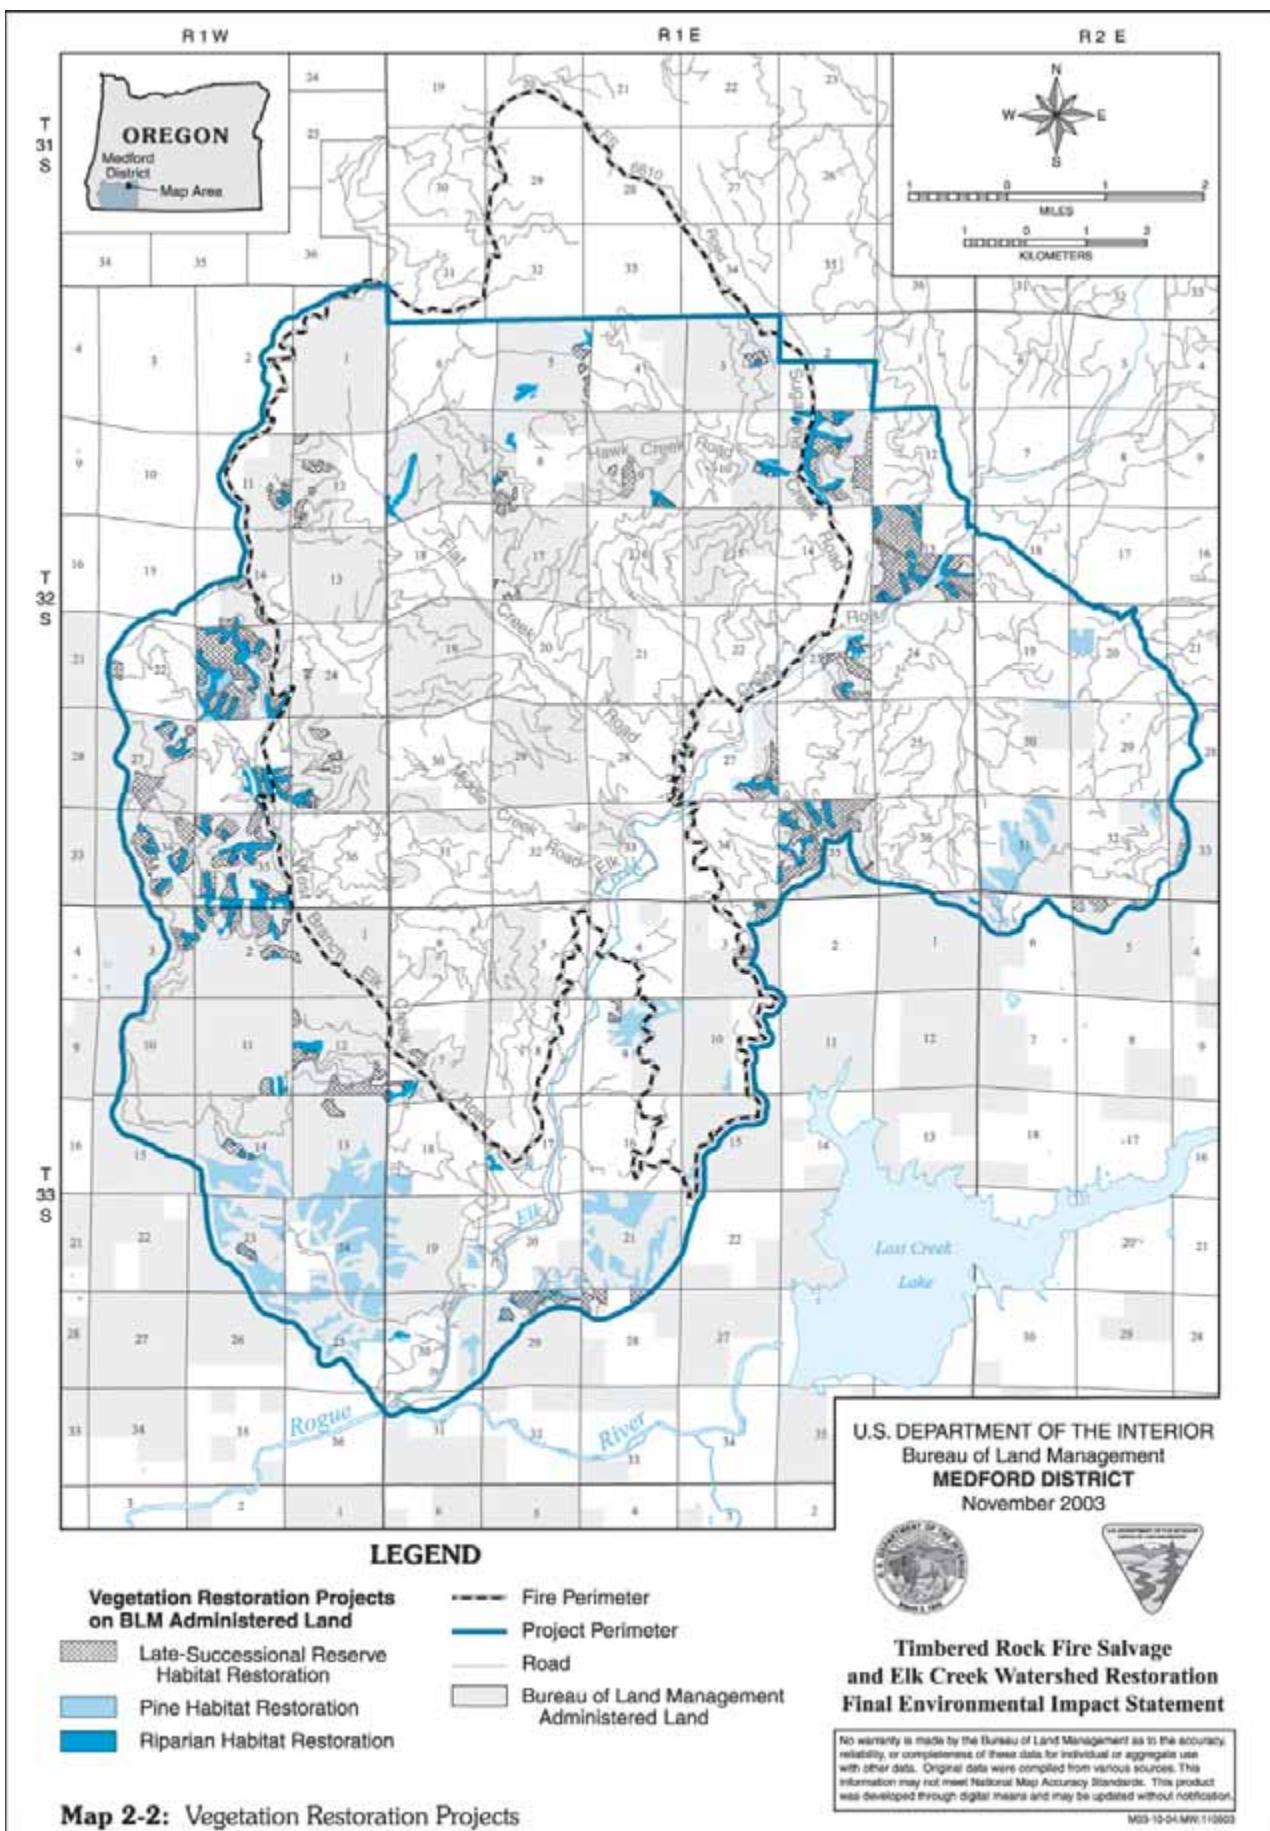

## **Riparian Reserve Thinning**

### **Project Objectives**

Improve the habitat and functioning of Riparian Reserves for late-successional dependent terrestrial and aquatic organisms. Accelerate the growth rates and size variability of residual trees in the existing stands and maintain species diversity.

### **Desired Future Conditions**

Functioning riparian area that allows for late-successional species movement and stream protection, and maintains species composition and characteristics needed to attain Aquatic Conservation Strategy. Attain 75 percent late seral vegetation in riparian areas. Riparian vegetation would be dominated by large (>24" DBH) conifers with a diverse species composition including riparian hardwoods and mixed conifer species. Conifer species of preference would be Douglas-fir, incense cedar, and pacific yew, with western hemlock and white fir in the upper elevations (above 3,500') and ponderosa and sugar pines in the lower elevations (below

## Chapter 2-Alternatives

3,000'), particularly on south exposures. Hardwood species to favor include alder, big leaf maple, and Oregon ash. Canopy closures would generally be greater than 70 percent. The stand would be able to supply amounts and distributions of coarse woody debris sufficient to sustain physical stability and complexity (USDI 1995, 22).

### Project Design Features

Stands of trees less than 8" DBH (10-30 years old) within Riparian Reserves would be pre-commercially thinned to accelerate the growth of residual trees. Retain unthinned patches up to one-half acre in size for every 10 acres thinned. Stands of trees greater than 8" DBH (30-80 years old) would have up to 12 dominant tpa selected and competing trees with crowns touching would be felled or girdled. This would be done to increase growth of residual trees, promote large branches on select trees, and develop the recruitment of large woody material for streams. Felling and girdling would occur on trees less than 20" DBH. Thinning would be performed on an irregular spacing with reserve trees selected to aid in the development of future stand characteristics such as variable spacing, multistory canopies, large limbs, and canopy gaps (USFS 2000). Pile and burn slash from treatments in stands <8" DBH. Leave a no-cut buffer zone 50' from streams containing coho salmon and 30' from all other streams.

Figures 2.3-5 and 2.3-6 are computer representations of a typical stand planned for Riparian Reserve thinning, showing the stand before and after treatment. These figures were developed using a stand visualization system from stand exam data collected in actual units proposed for treatment.

## Oak Woodland and Meadow Restoration (see Map 2-3)

### Project Objectives

Maintain or enhance oak woodland and meadow values for wildlife, range, plants, and biological diversity. Protect and improve special habitats within the Elk Creek Watershed.

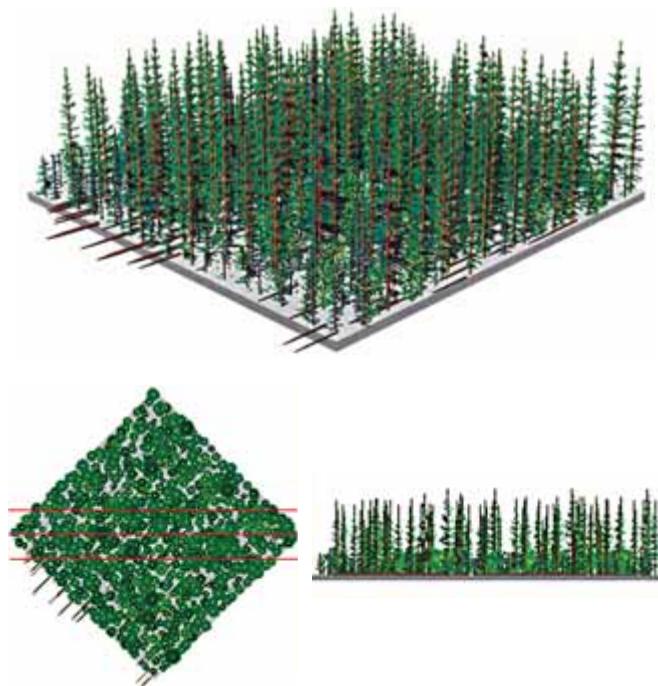

### Desired Future Conditions

Oak woodlands in an open condition that favors large oaks and pines and a diversity of native grasses, forbs, and shrubs and also provides for future regeneration of oaks and pines. Meadows would be in an open condition with healthy native grasses and forbs.

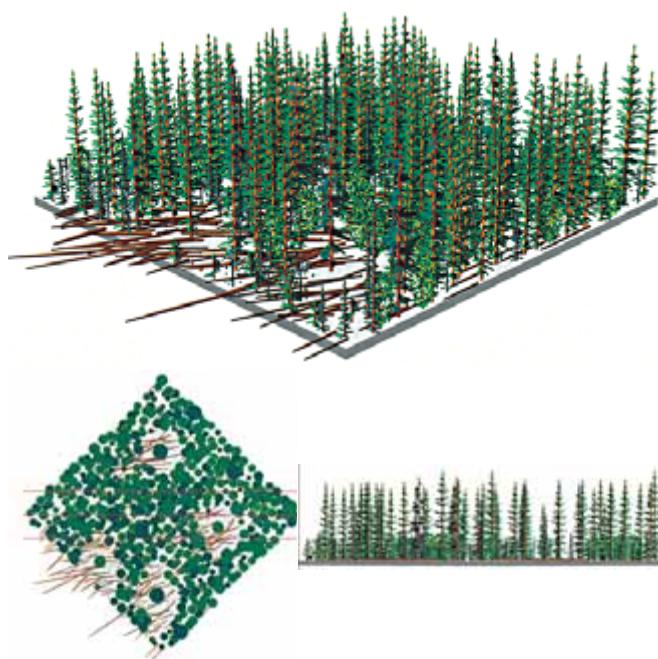

### Project Design Features

Management activities could include manually thinning small-diameter white oak; removing competing conifers; clearing around large, healthy pine; manually cutting, piling, and burning older brush patches; and applying frequent low-intensity prescribed fire. Meadow openings would be maintained by removing Douglas-fir and incense cedar from around the edges of meadows.

**Figure 2.3-5. Proposed Riparian Reserve Thinning – Before Treatment**

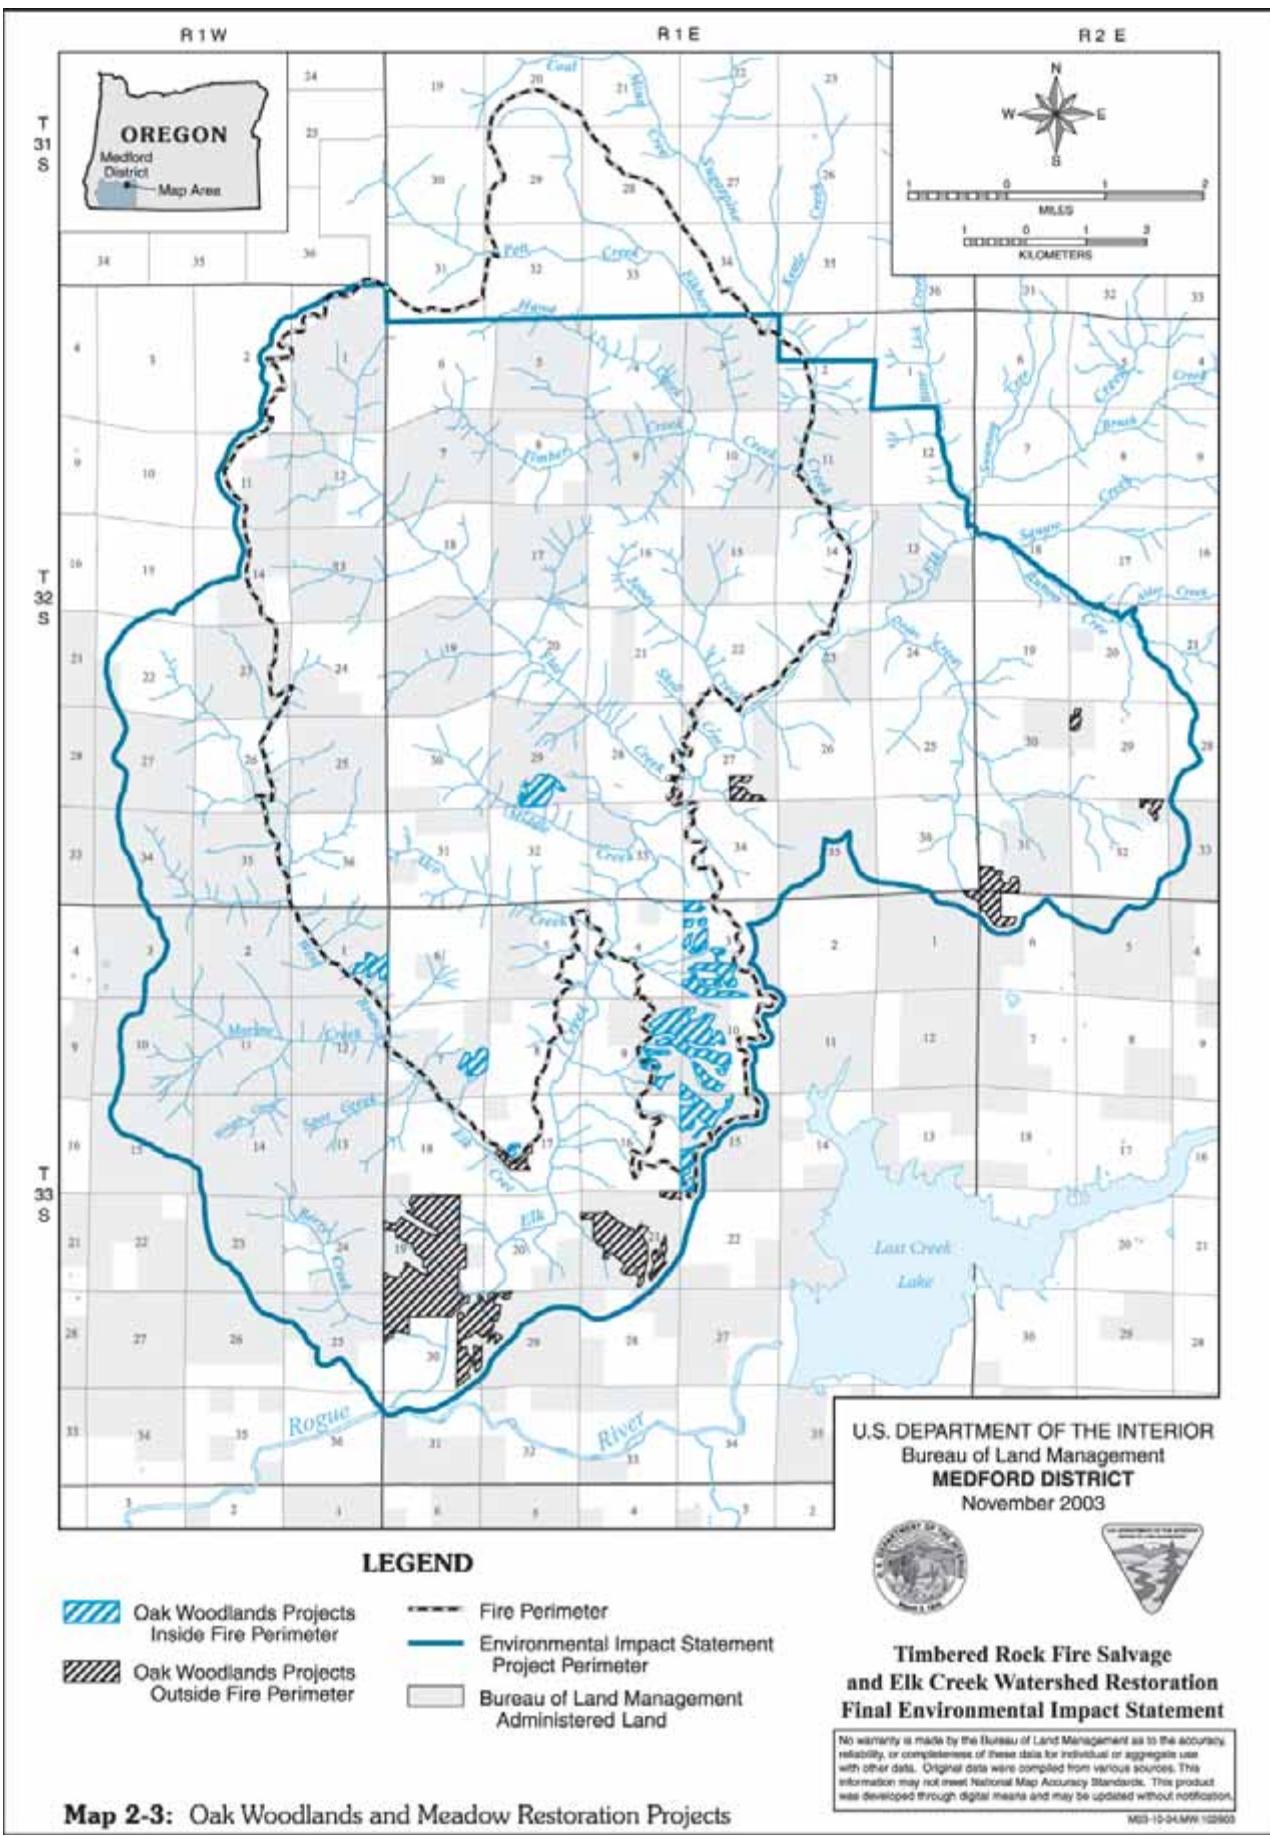

**Figure 2.3-6. Proposed Riparian Reserve Thinning – After Treatment**

Inside the fire perimeter, sites would be monitored and treatment applied when vegetative conditions warrant (in 5-15 years). Those conditions are:

- Numerous small conifer seedlings reappearing on a site.
- Large amounts of brush seedlings reoccupying the site.
- Oak resprouting or oak seedlings reoccupying the site.

Outside the fire perimeter, site-specific treatment would

include the following:

- Manually thinning small-diameter white oak.
- Manually thinning small competing conifers.
- Clearing around large, healthy pine.
- Manually cutting, piling and burning older brush patches.
- Applying low-intensity fire.
- Stagger treatments over several years so areas are treated at different times and oak woodlands are in different successional stages across the landscape. Treatments would not begin until at least 2004.

Prescribed fire would be applied under conditions when a low intensity, short-duration fire would occur. Heat flame-length would average 3 feet or less. Fires would need to be prescribed while reestablishing vegetation is small enough to be susceptible to the low flame lengths. Some manual slashing of woody vegetation may be required prior to burning in order to meet resource objectives.

## **Reforestation (see Map 2-4)**

### **Project Objectives**

Reforest areas that supported forest vegetation before the fire. Plant areas with species representative of the plant series existing in those forest stands. Place a stand on a pathway toward a mixed conifer forest that can, more quickly, obtain the attributes of a late-successional forest than would occur naturally.

### **Desired Future Conditions**

Mixed conifer stands at age 20 with a minimum of 70 percent canopy closure and a hardwood component of up to 25 percent of canopy. Retain a residual level of remnant overstory trees, snags, and coarse woody debris as described in stand advisories for late-successional habitat or the LSRA. This is an interim stage. The final condition for stands in this watershed is described in the proposed Late-Successional Forest Habitat Restoration project.

### **Project Design Features**

Areas burned at high or moderate severity levels would be planted with tree seedlings to a species mix consistent with those species present in those locations before the fire. Priority for planting would be in past plantations, areas with slopes greater than 65 percent, riparian areas, and remaining areas of high or moderate burn intensity, including spotted owl activity centers.

## **Reforestation Research Project**

### **Project Objectives**

To evaluate mixed-species reforestation plantings, to identify and characterize temporal patterns of vegetation structural development and species diversity, to assess temporal dynamics of fuels loading and fire risk, and to determine impacts of snag retention on survival and growth of planted trees.

For the initial phases of stand development, there are six specific research objectives to determine the effects of:

1. snag retention on the survival and establishment of planted seedlings by species,
2. planted seedling versus natural regeneration on tree survival and growth,
3. monoculture versus mixed-species plantings on planted seedling survival and growth,
4. planting density on survival and growth of planted seedlings by species, and site occupancy by planted and naturally regenerating trees, shrubs, and herbs,
5. weed control on planted seedling establishment and growth of trees, shrubs, and herbs, and
6. physiographic site conditions on planted seedling survival and growth of trees, shrubs, and herbs

### **Desired Future Conditions**

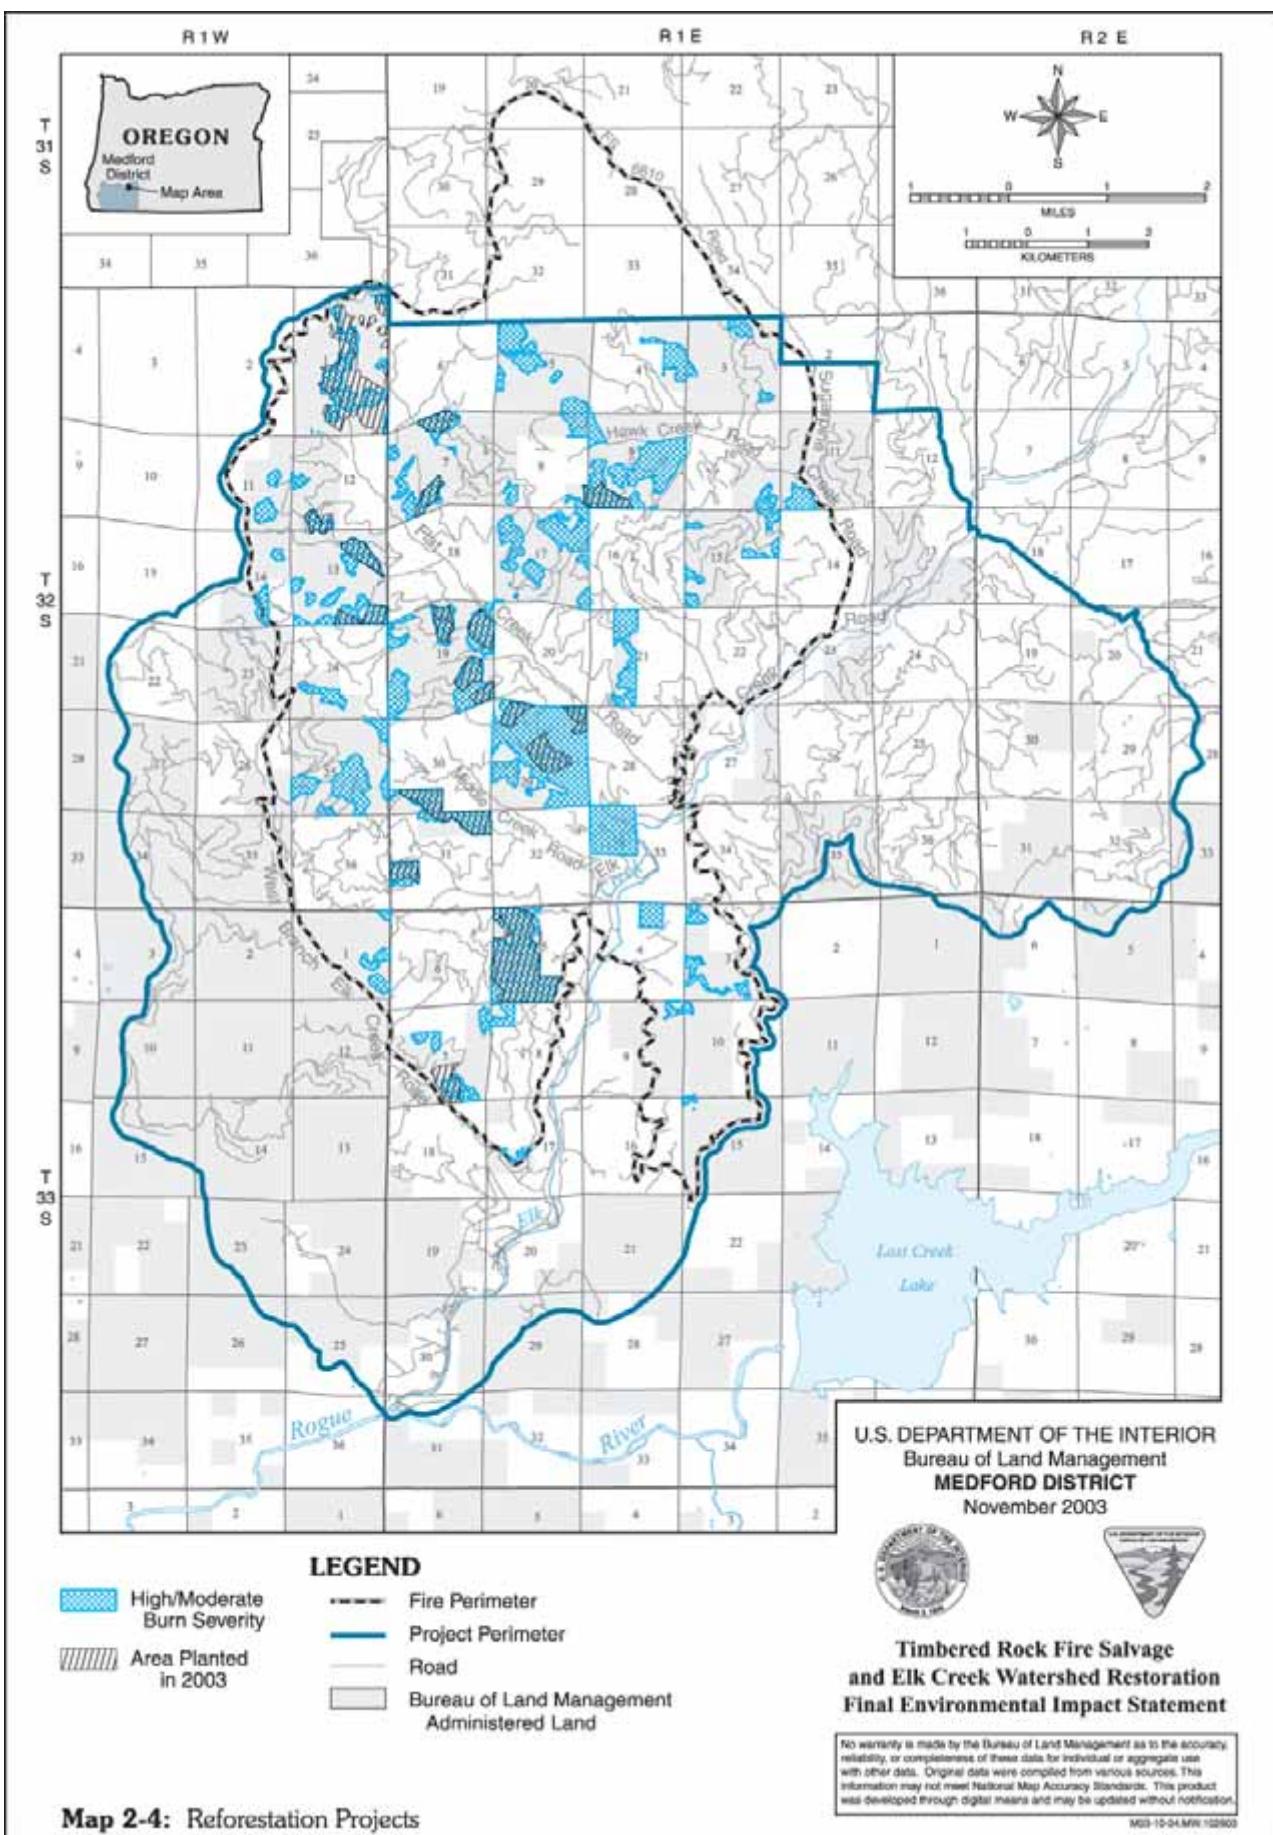

Forest stands having a high degree of species and structural diversity (relative to monospecific plantations) in which Douglas-fir, white fir, and incense cedar contribute to the main overstory canopy as codominants; dispersed sugar pine and ponderosa pine having complex canopy structure and large diameter stems and branches as dominants; and sub-canopy hardwood trees providing structural continuity between understory shrubs and the overstory.

### **Project Design Features**

This planting is a research project designed to provide a rigorous basis for evaluating the efficacy of snag retention, mixed-species plantings, variable planting density, and woody vegetation removal as means for regulating the development of biologically and structurally complex forest stands, and for varying the temporal dynamics of fuels profiles and fire risk.

Six species composition, planting density, and vegetation removal treatments (weeding) would be established:

1. Unplanted, woody vegetation not removed
2. Douglas-fir, planted at 435 tpa, woody vegetation removed
3. Mixed species planting, 435 tpa, woody vegetation removed

## Chapter 2-Alternatives

4. Mixed species planting, 435 tpa, woody vegetation not removed
5. Mixed species planting, 190 tpa, woody vegetation removed
6. Mixed species planting, 190 tpa, woody vegetation not removed

Woody vegetation removal on designated treatment plots will be completed manually prior to planting, in year 1 and in year 3; and in year 5 if necessary, following planting.

Species mixes will consist of the following:

- Sites 3500'+ elevation – Douglas-fir, 20%; White fir, 20%; sugar pine, 20%; incense cedar and ponderosa pine, 20%; hardwood sprouts (Pacific madrone and/or chinquapin oak) 20%.
- Sites <3500' elevation – Douglas-fir, 40%; sugar pine, 20%; incense cedar and ponderosa pine, 20%; hardwood sprouts (Pacific madrone and/or chinquapin oak) 20%.

Where specified, hardwood densities will be obtained by retaining hardwood sprouts, thinned to a single stem per clump, at the 20 percent proportion prescribed.

The treatments will be implemented on both unsalvaged and salvaged sites to evaluate effect of residual snags as microsite modifiers on seedling establishment. Some treatments will be replicated on moderate and harsh planting sites as defined predominantly by aspect (northerly vs. southerly), but also taking into account soil depth (shallow vs. deep) and slope position (mid vs. upper).

A total of 56, 1.5 acre plots will be established and allocated by treatment condition as outlined in Table 1 of the *Vegetation Dynamics and Fire Hazard in Experimental Mixed-species Restoration Plantings in Southwestern Oregon* in Appendix G - Research Proposal .

### 2.3.2.3 Fuels Treatment Projects (see Map 2-5)

#### Fuel Management Zones (FMZ)

##### Project Objectives

Create FMZs to assist in future wildfire suppression activities, to provide for firefighter safety, and to provide anchor points for control lines. To meet the LSRA recommendation for breaking the watershed into 5,000 to 7,000 acre blocks. Construction of FMZs would also meet intent of National Fire Plan by providing protection to Communities at Risk and Wildland Urban Interface areas.

##### Desired Future Conditions

A series of FMZs on the ridgelines, on the perimeter and

within the LSR. Anchor points for fire lines, burnout operations, and possible safety zones for firefighters. LSR divided by FMZs into blocks of 5,000 to 7,000 acres to reduce future fire size (see Figures 2.3-7 and 2.3-8).

#### Project Design Features

Within the burn perimeter, stand replacement areas less than 10 acres would be salvaged to reduce fuel loadings and reduce spotting potential. Proposed units would be located within an identified FMZ and cover approximately 10 acres. A target of six snags per acre would be left standing on or near the ridge top. The preferred leave snags would be the shorter snags. The understory vegetation would be cut, piled, and burned.

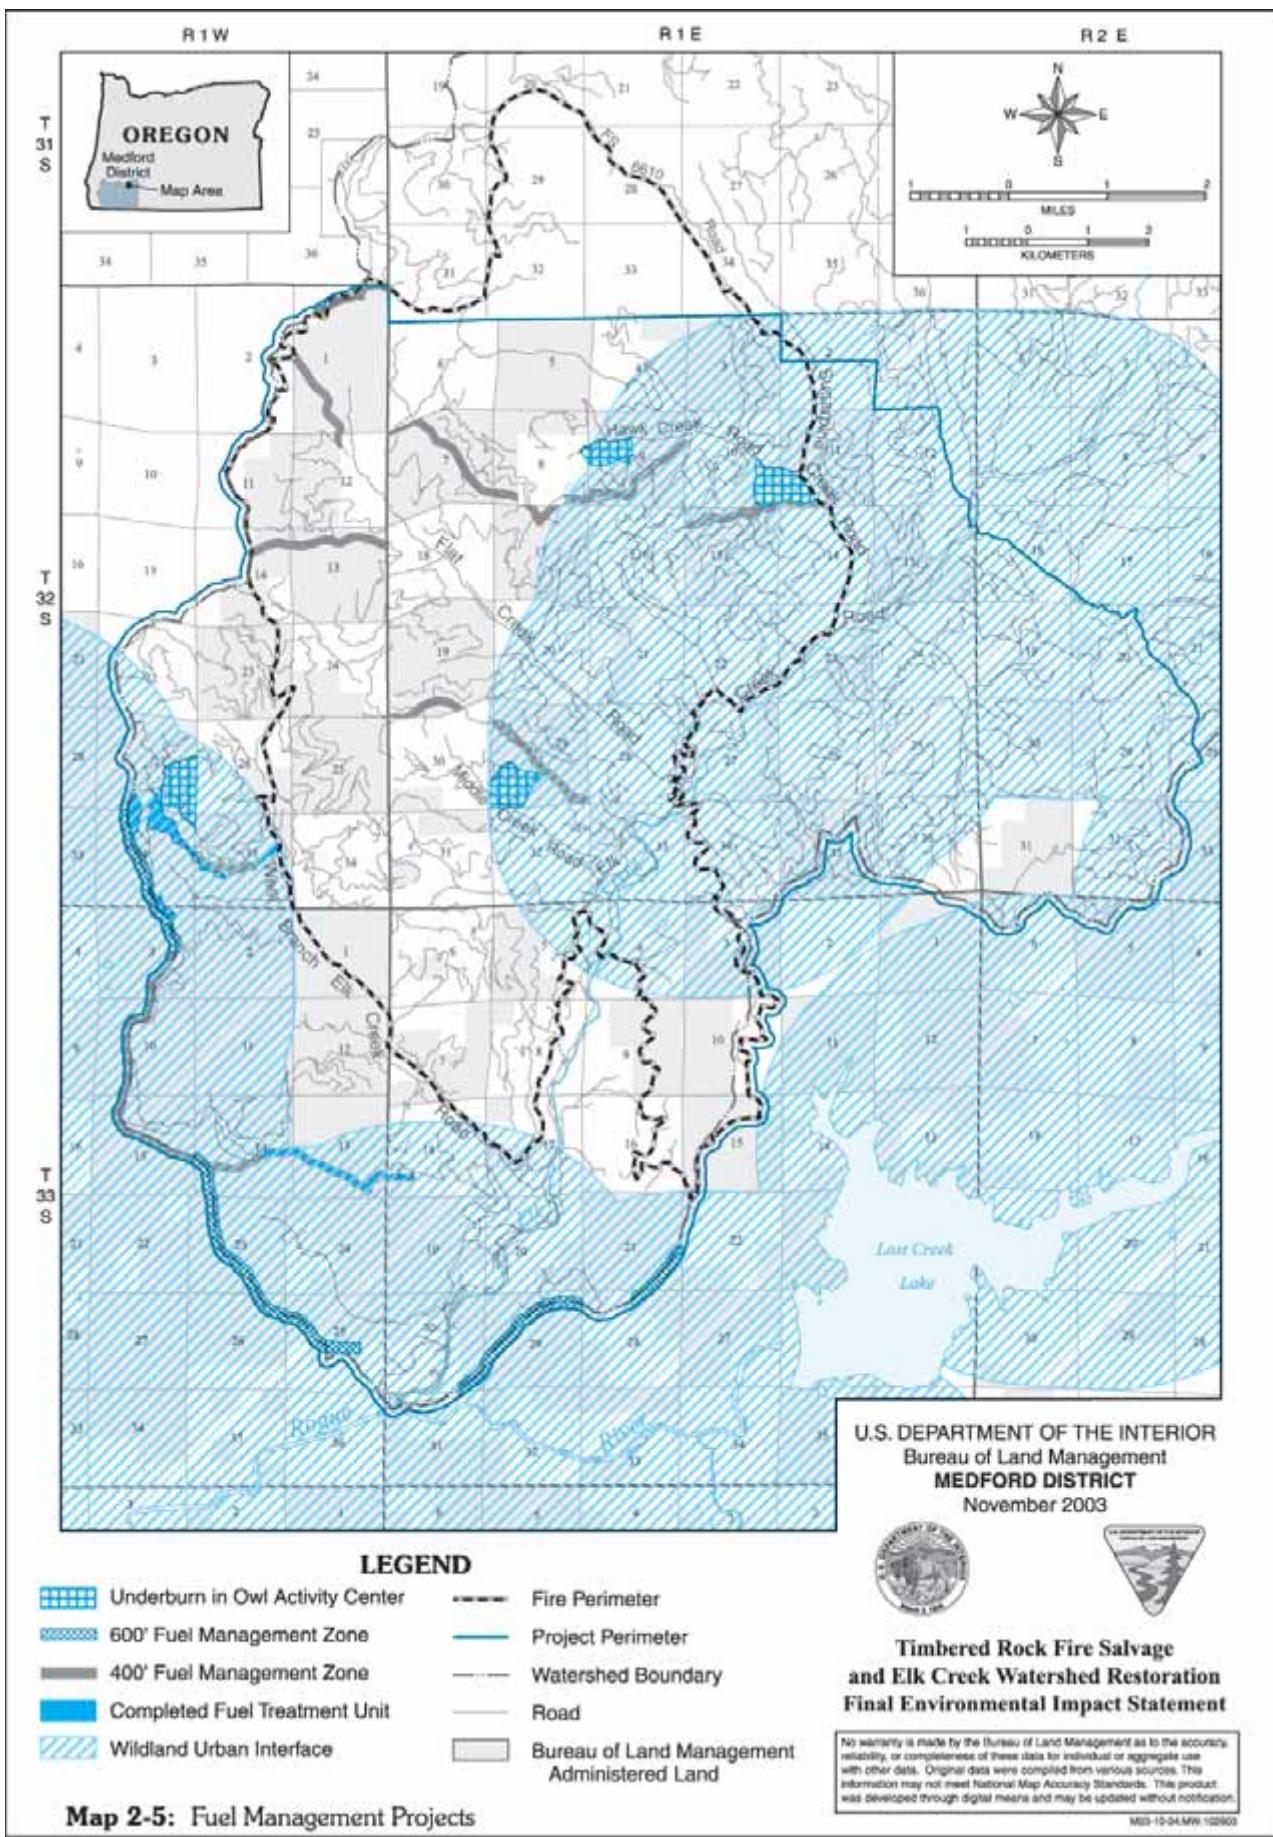

In FMZs proposed in the unburned portion of the watershed, the understory conifers and hardwoods would be thinned and slash would be hand-piled. Hand-cutting, hand-piling, and burning of brush would occur. The majority of the conifers cut would be 6" DBH and less. In some cases, small diameter commercial conifers would be cut and removed as needed to reduce crown bulk density to a level that would not perpetuate crown fires. After ladder fuel loadings are

**Figure 2.3-7. Existing FMZ**

**Figure 2.3-8. Aerial view of Existing FMZ**

reduced, an underburn would be conducted to further reduce ground fuels. This treatment would occur two to five years after the initial entry. A second underburn would occur 10-15 years later. At that time, initial treatment would be finished and any further treatments would be considered maintenance.

Removal of brush and sub-merchantable timber would be accomplished through hazardous fuel reductions contracts. Merchantable timber would be removed through a timber sale contract, where feasible. Approximately 35 acres located in T33S, R1W, Sections 14 and 15 would be proposed for commercial thinning.

The West Branch Fire of 1972, located in T32S, R2W, was reforested and pre-commercially thinned. This area burned again in the Timbered Rock Fire. Stand diameters range from 3-8 inches. Young conifers in this area killed in the Timbered Rock Fire would be cut, piled, and burned. This would aid in reforestation efforts and reduce fuel loads to help reduce future fire severity.

### **Owl Activity Center Underburns**

#### **Project Objectives**

The short-term objective is to reintroduce fire to maintain existing reduced fuel loadings and current fuel profiles created by the Timbered Rock Fire, and to simulate the historic natural disturbance process. The long-term objective is to increase the resiliency of sites during future high intensity fire events by reducing fire severity while maintaining owl habitat in late-successional forest conditions.

#### **Desired Future Conditions**

Multi-storied stands with low ground fuel loadings. These stands would have a break in the ladder fuels from the ground to the overstory canopy layer.

#### **Project Design Features**

This action would capitalize on the natural fuel reduction created by the Timbered Rock Fire. The proposal calls for underburning when fuel moistures for the larger, 6-inch or greater (1000-hour) fuels are at a level too moist for total consumption. The primary carrier of the prescribed fire would be the 0 to 3-inch (1- to 100-hour) fuels, litter layer, and any small brush the fire would consume. These treatments are being proposed on a limited scale to demonstrate effectiveness and ability to meet prescription requirements. The units would be configured using logical topographic breaks and may include all or portions of the owl activity centers and some adjacent areas. In addition, some burning outside the activity centers would be proposed using logical topographic breaks. Burning would occur outside of nesting season.

Initial entry would be in the next 2-3 years or later, if site conditions warrant. The need for follow up treatments would be evaluated and treatment would be proposed when fuel buildups approach the mid- to high-range of Fuel Model 11, or prior to reaching the mid-range of Fuel Model 10 (see Appendix M for fuel model descriptions). The second treatment would occur in 5-10 years and further treatments would occur in the 10- to 20-year range. All treatments will be based on actual conditions and timeframes are approximate. Seasonal restrictions would be implemented to avoid disturbing spotted owl nesting activities.

### **2.3.2.4 Wildlife Projects (see Map 2-6)**

#### **Eagle Nesting Habitat Enhancement**

##### **Project Objectives**

To promote growth and future development of large overstory trees into trees with large limbs or broken tops suitable for nesting eagles.

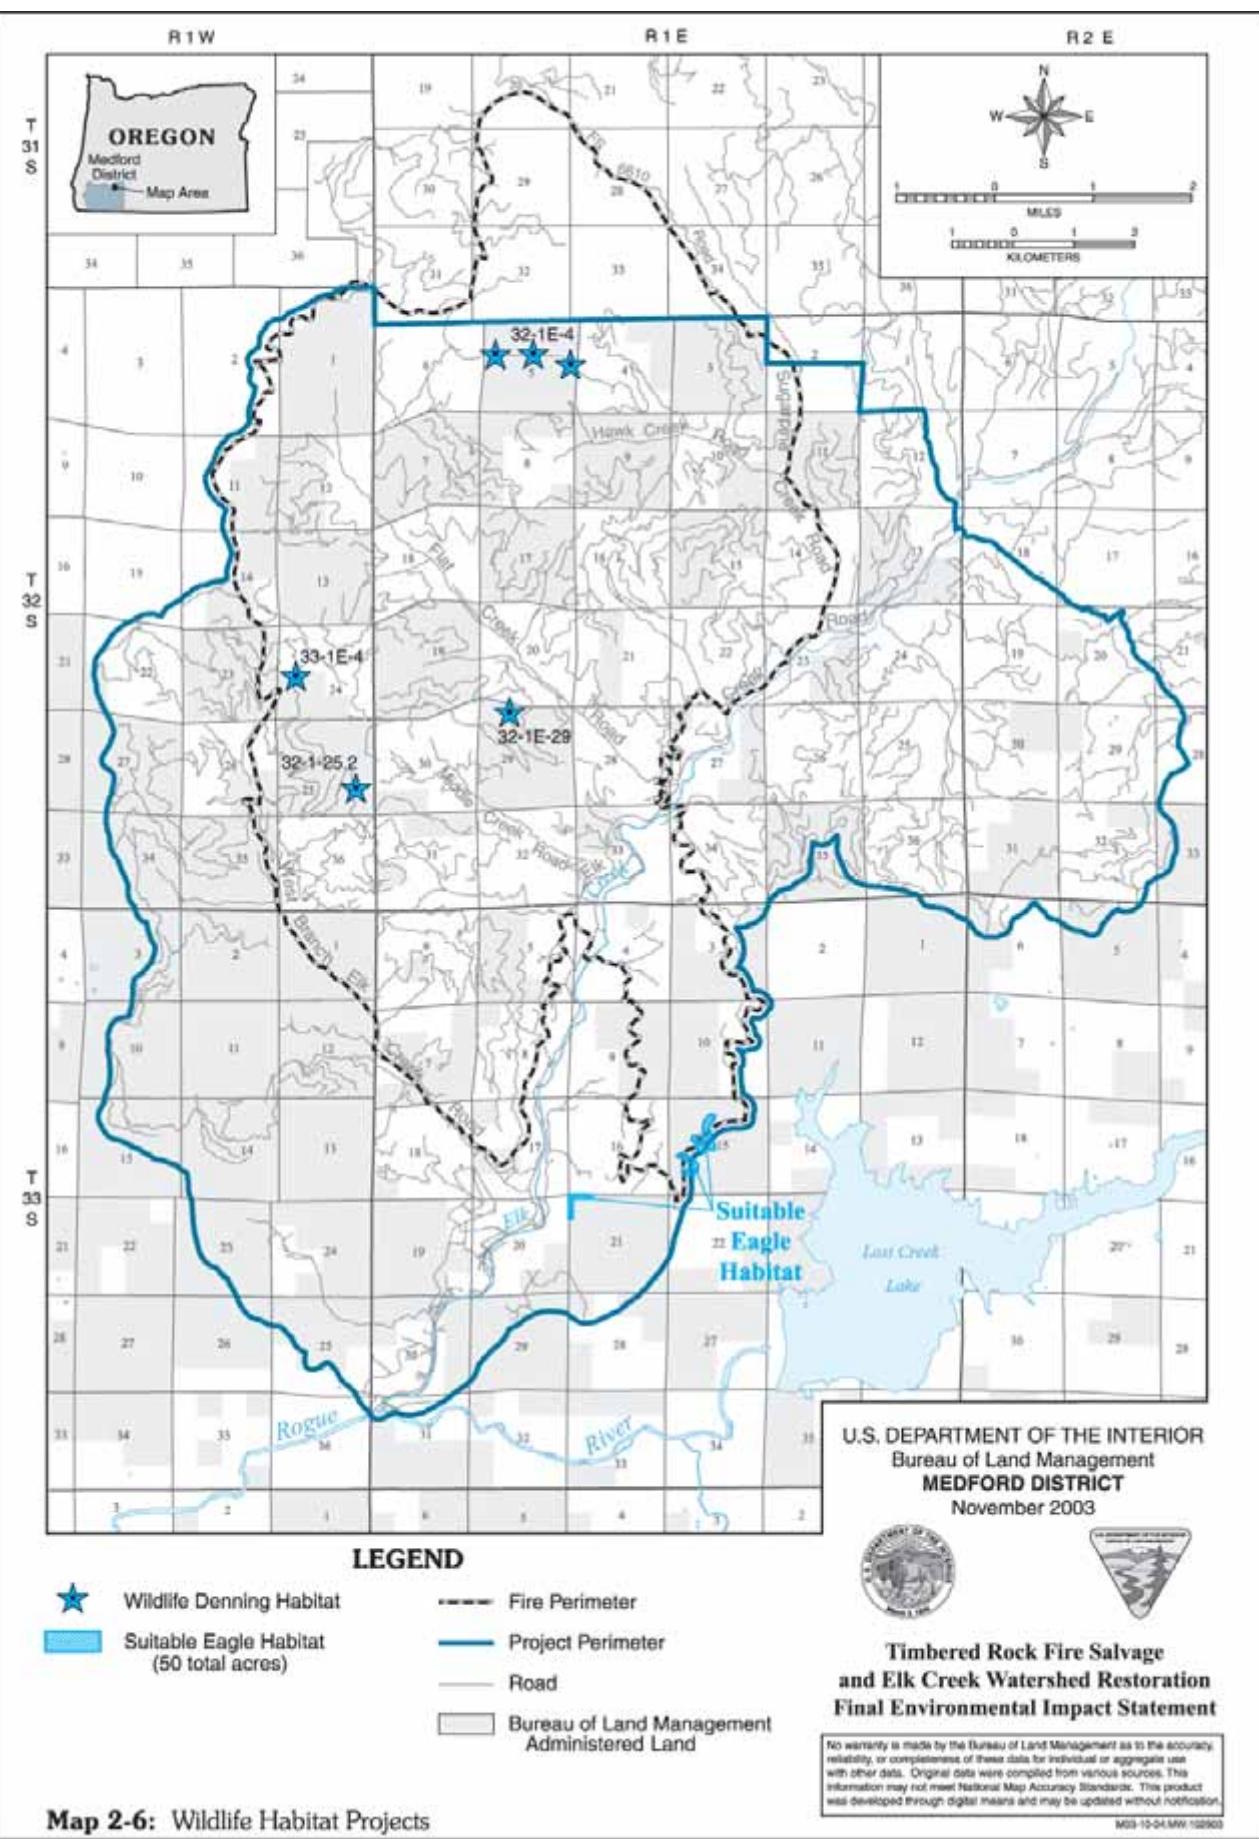

##### **Desired Future Conditions**

Scattered individuals and groups of large overstory ponderosa pine, sugar pine, and Douglas-fir trees with large limbs suitable for supporting eagle nests and with openings between branching whorls. The trees would have an open or broken canopy or would be located near the edge of the stand so the eagles would have an unrestricted flyway. Tall perch trees would be present at the edges of the stand. These nest stands would be located on the ridge between Lost Creek Lake and Elk Creek.

##### **Project Design Features**

Younger stands would be treated to promote growth of large overstory ponderosa pine, sugar pine, and Douglas-fir with large boles and thick limbs, strong enough to support the large stick nests built by bald eagles and golden eagles. Smaller trees around the meadow edges would be thinned. A residual conifer spacing of 12-20' would be implemented in stands less than 30 years old to promote the development of large trees with the desired habitat attributes, such as large limbs and whorls.

Stands with existing large overstory trees, treatments would improve the vigor of large overstory sugar pine, ponderosa pine, and Douglas-fir. Removing competing vegetation around selected trees would increase resistance to mortality from fire. Vegetation would be removed around the reserved large trees by clearing 10-15' out from the drip line of the pine. Co-dominant trees with crowns touching the selected trees would be removed unless the removal would harm reserve trees. Projects would be coordinated with proposed fuel management projects.

## *Chapter 2-Alternatives*

Two areas are proposed for treatment:

- T33S, R1E, Section 15 - Around the meadows in the north central part of the section and the NWSW part of the section. The project would occur along the west side of the meadow and extend 300 feet into the stand. Two areas extend outside the project boundary into the Lost Creek Watershed; approximately 200 feet in one area and 100 feet in the second area.
- T33S, R1E, Section 21 - Located within a proposed pine restoration project area. The project would occur along the north and west edge and extend 300 feet into the stand.

inadequate snags in an area near the selected location.

### **2.3.2.5 Road Projects (see Map 3-3b)**

#### **Road Reconstruction**

##### **Project Objectives**

Stabilize roads to reduce the risk of road failure.

##### **Desired Future Conditions**

Roads in a stable condition with a low risk of failure.

##### **Project Design Features**

Add drainage structures such as culverts and armored drain dips to reduce the chance of the road becoming saturated by water and failing. Remove unstable material from shoulders of roads and place large rocks on the face to armor the surface and function as a retaining structure to hold the fill in place. It is anticipated there would be a greater need for maintenance on roads within the fire over the next few years.

#### **Road Stream-Crossing Upgrades**

##### **Project Objectives**

Reduce the risk of road damage from debris torrents plugging culverts and diverting stream flows down roads.

##### **Desired Future Conditions**

Road fills constructed of rock, rather than mixed soil and rock fills at stream crossings in high risk locations. Road segments below the pipe would be protected from water or debris torrents diverting from the channel and eroding a gully in the roadbed.

##### **Project Design Features**

Road fills constructed out of soil and rock fill material at high risk stream crossings would be replaced with rock fills. These fills would be designed with a dip over the culvert to keep the stream flow in the channel in case the culvert plugs. Culverts would be upsized to pass 100-year storm events and allow movement of water, gravels, and debris through the culvert.

#### **Road Maintenance**

##### **Project Objectives**

To restore or improve road segments identified in the Transportation Management Objectives (TMO) process to the desired standard.

##### **Desired Future Conditions**

To maintain road access through BLM-administered lands

## **Maintain or Create Log Piles for Wildlife Habitat**

### **Project Objectives**

To provide denning/hiding/resting/foraging/escape sites for animals, including larger mammals such as American martin, fisher, bobcat, cougar, and bear.

### **Desired Future Conditions**

Scattered piles of large wood with spaces to provide denning, hiding, resting, foraging, or escape sites for animals, including larger mammals such as American martin, fisher, bobcat, cougar, and bear.

### **Project Design Features**

During salvage operations, leave piles of fallen logs in the selected areas where trees were cut to clear the right-of-way for the Pacific Power powerline in T32S, R1E, Section 5. Selected piles would be located near the east and west borders of section and one in the middle, away from the road.

Place or leave three additional piles of larger wood between West Branch Elk Creek and Flat Creek. These would be at or near the end of a road that will be closed either with a permanent block, earthen berm, or gate. This would be completed as part of the roadside salvage. Piles would be located in areas where roads identified for decommissioning are closed to traffic.

Piles should be approximately 20' x 20' and 4-6' high and provide space to allow animals access within the piles. Larger logs (>16" DBH) would be stacked in a loose, crisscross/haphazard pile in a way that would create spaces beneath the wood. The logs could be smaller lengths, broken tops, and boles large enough to stack with spaces between.

Logs would be obtained from salvage operations. Broken parts and whole logs would be hauled to location and piled. Piles should be located in the largest accumulation of trees. Pile locations could be moved to a different site if adjacent land owners object to specific road closures, or if there are

while minimizing erosion and sedimentation from these roads and protecting water quality.

### **Project Design Features**

Roads would be maintained and improved, as needed. Maintenance may include: blading and shaping the road surface, adding rock to the road surface, brushing the roadsides, cleaning the ditches, cleaning culvert catch basins, cleaning or replacing culverts, and adding drainage structures such as culverts and drain dips.

### **Road Decommissioning**

#### **Objectives**

To reduce the road density in the Key Watershed by decommissioning road segments identified in the TMO process. In addition, identify road segments for closure to reduce wildlife harassment, degradation to the road surface, and trash dumping.

#### **Desired Future Conditions**

Appropriate access to provide for administrative needs and public use. Most roads out of the riparian areas, and few with native surfaces. Access across public lands through reciprocal rights agreements will be maintained.

#### **Project Design Features**

Roads will be decommissioned or closed as identified from the TMO process.

### **Seasonal Road Closures (see Map 2-7)**

#### **Objectives**

Reduce damage to road surface during the wet season and protect sensitive fish species from surface road erosion; protect wildlife from poaching and harassment; and reduce trash dumping.

#### **Desired Future Conditions**

Year-round vehicle access would be restricted to mainline roads. Secondary and non-surfaced roads would be seasonally closed to motorized vehicles from mid-October through April 30. Only foot and non-motorized traffic would be allowed on closed roads during the wet season. All roads would be available for motorized vehicle traffic (unless fire restrictions are in place) from May 1 through mid-October. Roads would remain open to administrative access for landowners, BLM employees, and BLM contractors and permittees.

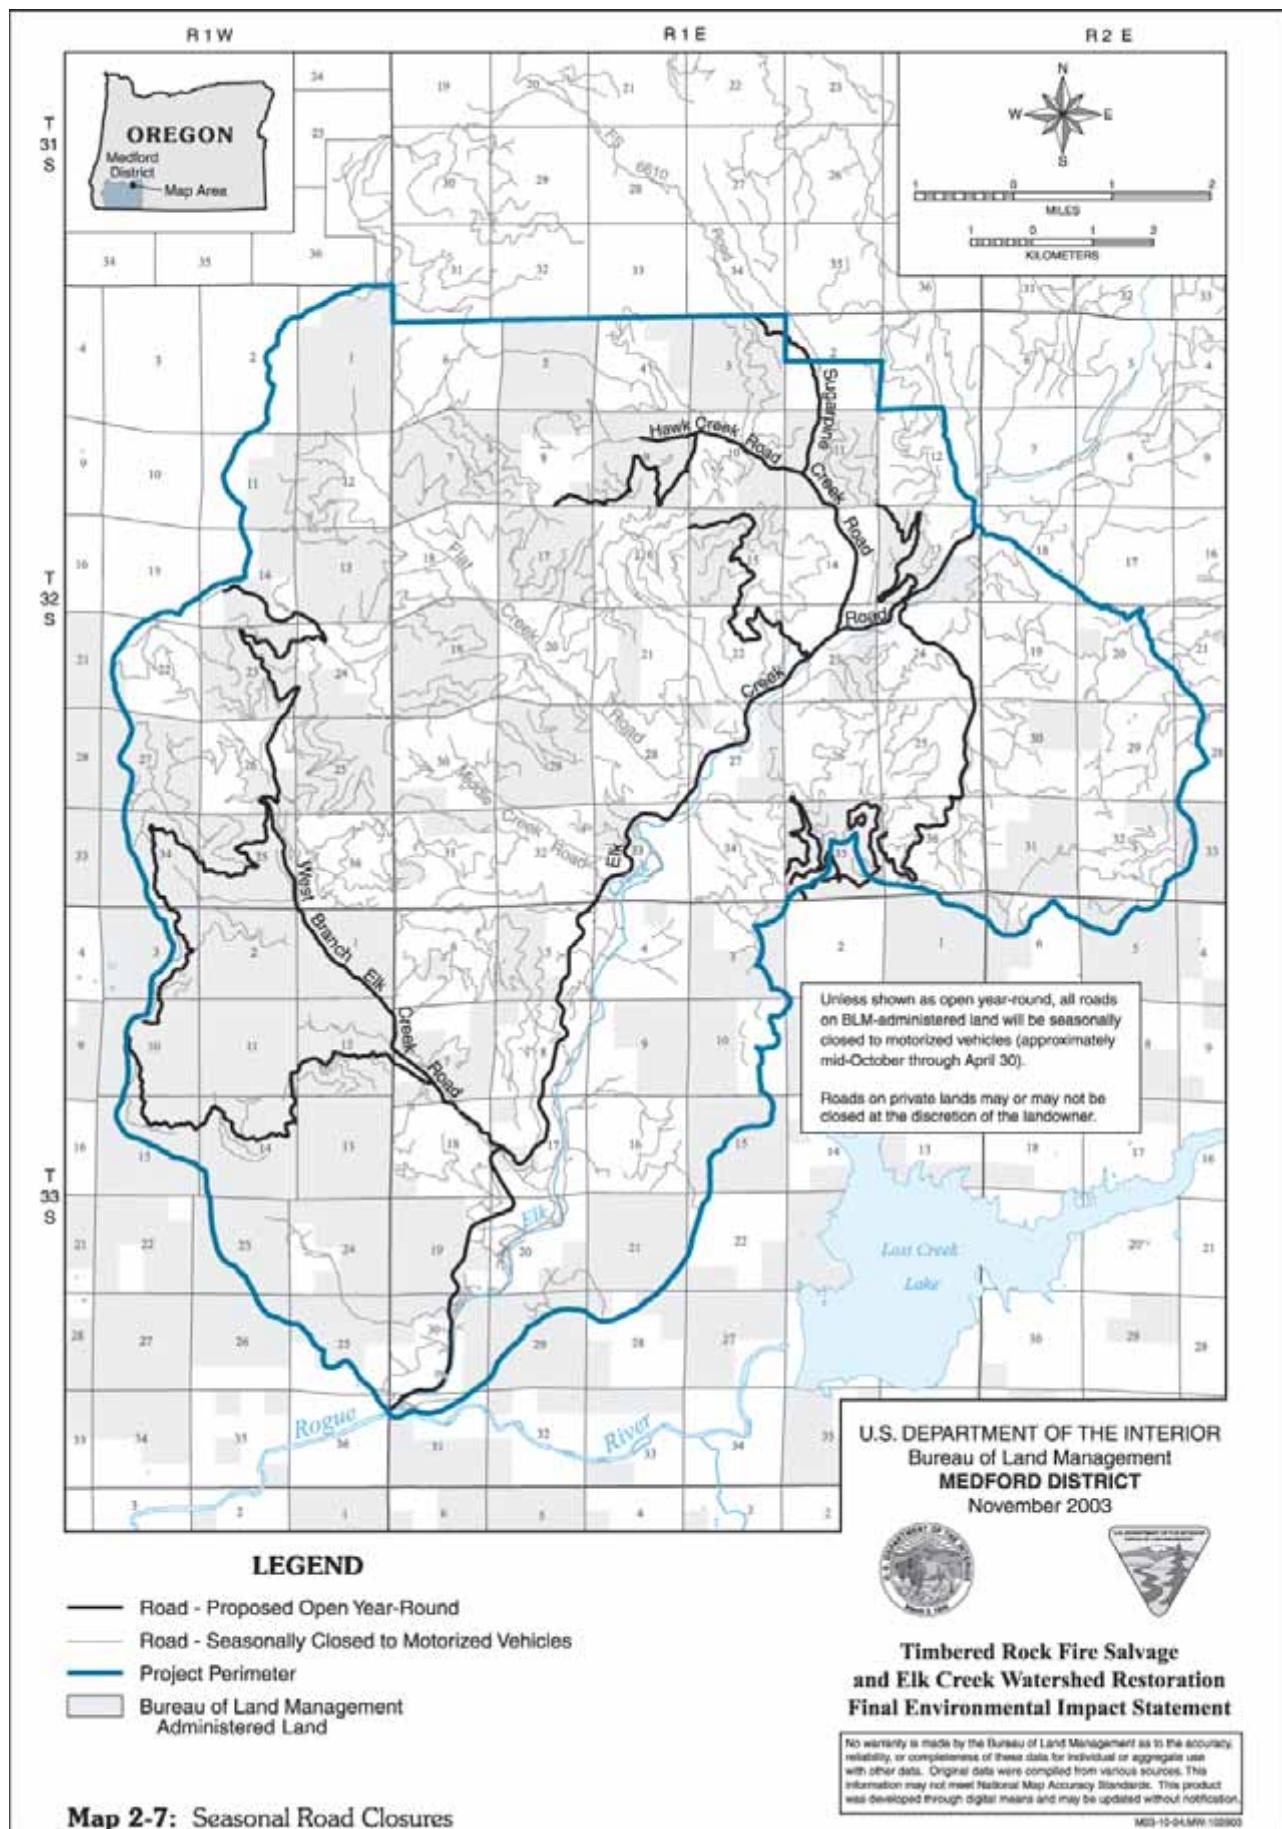

#### **Project Design Features**

Road closures would be seasonally closed to motor vehicles from mid October through April 30. Roads

across private lands may or may not be closed by the landowner.

Mainline roads open to motorized vehicles year around:

- 33-1W-8.0, Buck Rock Road to West Branch;
- 33-1W-10.0;
- 32-1W-26.1, Morine Tie Road;
- 33-1E-17.0;
- 32-1W-26.0 to intersection with 32-1W-23.2, West Branch Elk Creek Road;
- 32-1W-26.5, Alco Creek Road
- 32-1E-27.0;
- 32-1E-18.0 to intersection with 32-1E-18.3;
- 32-1E-20.0 to 32-1E-17.4;
- 32-1W-13, Flat Creek Road;
- 32-1E-17.4 to 32-1E-17.5 to 32-1E-7.2;
- 32-1E-23.2;
- 32-1E-22.0, Miller Mountain Road;
- 32-1E-23.0 to intersection with 32-1E-9.1, before stream ford, Sugarpine Creek Road;
- 32-1E-10.1 to 32-1E-9.0;
- 32-1E-9.0, Gobblers Knob Road;
- 32-1E-11.4 and FS 31, Elkhorn Ridge Road;
- 32-1E-13.1 to intersection with 13.2 and 32-1E-13.2 to end of rocked area at boundary with section 11, North Mule Hill;
- 32-1W-23.2, Ragsdale Butte;
- 32-1W-36.1.

### 2.3.2.6 Pump Chance Reconstruction (see Figure 2.3-9)

#### Project Objectives

To restore existing pump chances and helicopter dip ponds for future fire suppression needs.

#### Desired Future Conditions

To have pump chances and helicopter dip ponds that will hold adequate pools of water, about 500 gallons, to be used primarily for initial attack fire suppression.

#### Project Design Features

Seven sites have been identified for restoration. The work would include cleaning pump chance pools by excavating gravels, soil, and vegetation that have built up. Excavated materials would be moved to an appropriate disposal site. Water inlets and outlets would be cleaned or repaired and rock would be added to access ramps as needed. Access ramps should have an adequate rock surface and be brushed to accommodate up to 4,000 gallon water tenders. Cascade Frogs would be protected by a seasonal restriction with no restoration occurring from mid-March to August 31.

### 2.3.2.7 Rock Quarry Closure and Rehabilitation (see Figure 2.3-9)

#### Project Objectives

To close and rehabilitate rock quarries where the usable rock has been depleted and to minimize erosion from steep side slopes and lack of vegetation.

#### Desired Future Conditions

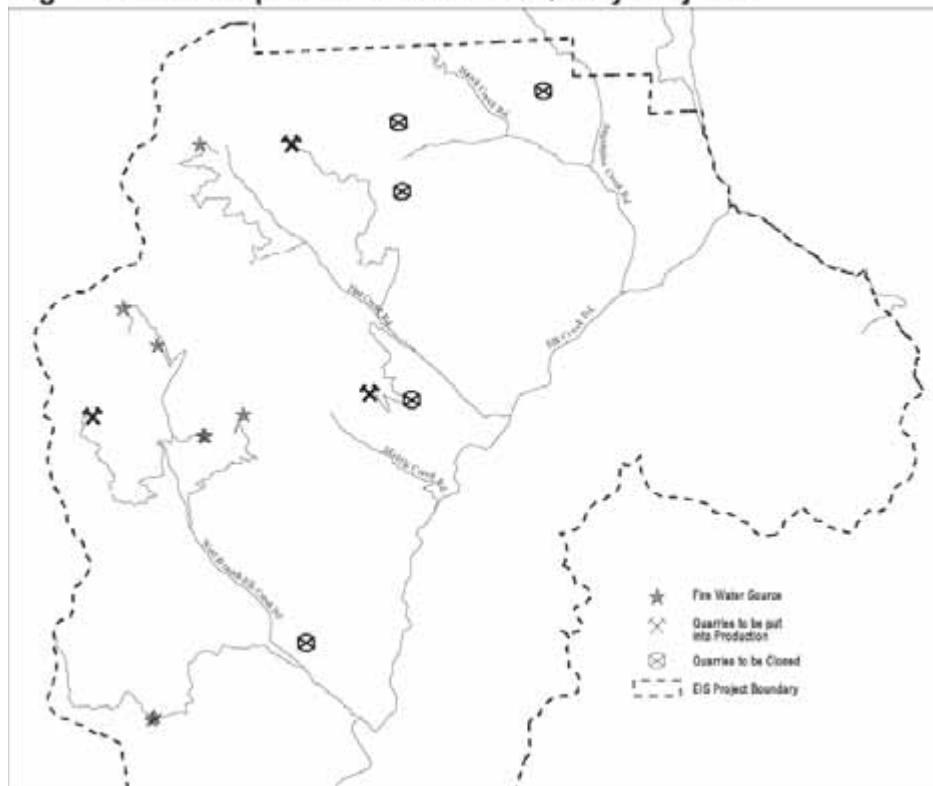

Abandoned rock quarries with vegetation growing in them and blended into the landscape.

#### Project Design Features

Rock quarries that are no longer viable would have benches sloped, soil imported (if necessary), and vegetation planted. Any oversized or usable material would be stored at the quarry or moved to another location where it would be stored until needed.

Five quarries are proposed for treatment: Gobblers Knob, Elk Horn Creek, Hawk Creek, Old Flat Creek, and West Branch Elk Creek.

**Figure 2.3-9. Pump Chance and Rock Quarry Projects**

## 2.4 Alternatives

### 2.4.1 Alternative A No Action or Continuation of Current Management

#### 2.4.1.1 Salvage

##### Area Salvage

- No programmed area salvage.

##### Salvage of Roadside Hazard Trees

- Salvage of hazardous trees would be determined through appropriate NEPA documentation.

#### 2.4.1.2 Restoration

Continue current management under NFP and RMP direction and the Timbered Rock Fire Emergency Stabilization/ Rehabilitation Plan (ESRP). Continue to plan and implement other restoration projects as funding and time permits.

Projects identified in the ESRP:

- Plant trees within fire perimeter (6,000 acres).
- Cancel cattle grazing for 2003 and 2004 season.
- Survey for and treat noxious weeds along firelines.
- Seed with native grass.
- Seed intensely burned areas greater than 35 percent slope, disturbed areas, meadows, and non-timbered lands.
- Provide structure in stream channels using natural material or construct check dams.
- Add large wood to Hawk, Sugar Pine, Timber, Flat, Middle, Elk, and West Branch Elk creeks and six unnamed tributaries.
- Collect seed to grow native riparian species.
- Plant hardwoods and brush species in Riparian Reserves.

### 2.4.2 Alternative B No Salvage and Focused Restoration

#### 2.4.2.1 Salvage

##### Area Salvage

- No programmed area salvage.

##### Salvage of Roadside Hazard Trees

- Salvage of hazardous trees would be determined through appropriate NEPA documentation.

#### 2.4.2.2 Restoration

Implement a focused level of restoration projects. Emphasis would be placed on reducing non-commercial size vegetative competition in overstocked stands with density management treatments, fuels reduction treatments, and pine habitat restoration. Areas proposed for treatment would be those in most need of competing vegetation reduction. Within the fire perimeter, restoration would focus on high priority road work. LSR restoration actions would focus on non-commercial projects.

##### Fish Habitat Improvement

- Replace 4 culverts.
- Install 3 rock weirs per mile.
- Install 15 instream logs per mile.

##### Vegetation Projects

###### LSR Forest Habitat Restoration

- Pre-commercial thin 1,102 acres of stands 10-30 years old; greater than 40 percent canopy closure; less than 8" DBH.

###### Pine Habitat Restoration

- Pre-commercial thin 156 acres of stands with pine 10-30 years old; less than 8" DBH.

###### Riparian Reserve Thinning

- Thin 117 acres of stands 10-30 years old; 40 percent or greater canopy closure; less than 8" DBH.
- Perennial streams.

###### Oak Woodlands and Meadow Restoration

- Thin 1,003 acres; less than 8" DBH; underburn.
- Treat high priority areas (outside Timbered Rock Fire perimeter).

###### Reforestation

- Priority areas for planting:
  1. Pre-fire plantations.
  2. Severely burned areas with slopes greater than 65 percent.
  3. Stand replacement areas greater than 10 acres.
  4. High priority riparian areas (high burn severity areas).
  5. Fifty foot strips along high burn severity fish streams.
- Plant at 10' x10' spacing with microsite emphasis (planting next to logs, stumps, etc.).
- Replant if stocking falls below 100 trees per acre (tpa).
- Plant mixed species.
- Avoid mulching, tubing and shading until replanting.
- Remove competing brush around all seedlings if stocking less than 250 tpa.
- Remove brush around half the trees if stocking greater than 250 tpa.

## Fuels Treatment Projects

### Fuel Management Zones (FMZ)

- Treat 1,300 acres along ridgelines 400' outside the LSR and 200' within the LSR.

### Owl Activity Center Underburns

- Underburn 425 acres within 4 owl activity centers; 3 within the fire perimeter and 1 outside the fire perimeter but within the LSR.

### Fuels Treatment within West Branch Fire

- Cut, pile and burn fire-killed trees <8" DBH within old burn.

## Wildlife Projects

### Eagle Nesting Habitat Enhancement

- Thin 50 acres; thin thickets of trees 10-30 years old around adjacent meadows to 12-20' spacing; clear 10-15' from dripline around existing larger overstory trees.
- Thin trees less than 8" DBH.
- Leave larger cut trees on site.

### Log Piles for Wildlife Habitat

- No sites would be developed.
- Previously felled trees along Pacific Power powerline in T32S, R1E, Section 5 would be left in place.

## Road Projects

### Road Reconstruction

- Reconstruct 2.6 miles of road.
- Add drainage structures and rock blankets.

### Road Stream-Crossing Upgrades

- Upgrade 15 sites at highest risk of fill failure.
- Replace existing culverts to pass 100-year storm event.
- Replace existing road fill with rock fill.

### Road Maintenance

- Renovate or improve 100 miles.

### Road Decommissioning

- Partial decommission of 2.5 miles of road.
- Full decommission of 32 miles of road.
- Close 21 miles of road with a gate or guardrail barricade.

### Seasonal Road Closures

- None.

### Pump Chance Restoration

- Restore 7 sites.

### Rock Quarry Closure and Rehabilitation

- Close and rehabilitate 5 quarries.

## 2.4.3 Alternative C

### South Cascades LSRA Criteria for Salvage and Moderate Restoration

#### 2.4.3.1 Salvage

##### Area Salvage

- Salvage 247 acres using guidelines from the South Cascades LSRA (see Appendix B).
- Harvest in stand-replacement patches greater than 10 acres; less than 40 percent canopy closure.
- Use small patch clear cuts or group selection – (LSRA example: In a 50-acre unit, ten 5-acre units are preferable to one 50-acre unit).
- Harvest systems would include:
  - cable - 123 acres
  - tractor - 21 acres
  - helicopter - 91 acres
  - bull-line - 12 acres
- Construct and rehabilitate .25 miles of temporary road.
- No new permanent roads.
- Roadside hazard acres within available area salvage units would contribute to the salvageable acres of that unit.
- Salvage a minimum of 10 percent and maximum of 20 percent of available acres per stand in stand replacement units where snag densities exceed the median “typical level” (see Appendix B, Table 50 in LSRA). Typical levels are determined by Plant Series. Maximum salvage treatment area would be based on the percent of the existing snag density above this typical level (see Appendix D for stand snag summary).

If Existing snag density is,	then Salvage
0 - 10% above typical levels	10% of stand-replacement acres
11% - 20% above typical levels	Equal % of stand-replacement acres
20% or more above typical levels	20% of stand-replacement acres

- Follow Landscape Decision Process Criteria (see Appendix B) for each stand.
- Prohibit salvage in the following areas:
  - Low and very low burned areas (40 percent or greater live canopy).
  - Riparian areas.
  - Patches less than 10 acres.

- Retain all pre-fire CWD and snags.

### **Salvage of Roadside Hazard Trees**

- Roadside salvage 1,078 acres.
- Salvage previously felled hazard trees along Pacific Power powerline in T32S, R1E, Section 5; felled trees in riparian areas, needed to meet CWD requirements, or for log piles for wildlife habitat project would be left.
- BLM would identify and salvage hazard trees along roads or roads needed for post-fire operations except roads within riparian areas and owl activity centers with suitable habitat.
- BLM would identify only immediate hazards along proposed haul roads within riparian areas and owl activity centers.
- Hazard trees identified by road users within riparian areas and remaining owl activity centers with suitable habitat would be felled and left in place, except where trees or portions of trees fall within road prism.
- Snag levels would be met within adjacent areas not identified as hazard trees.
- Pre-fire CWD would be left.
- Hazard trees would be identified according to OSHA guidelines (see Appendix D for guidelines).

### **2.4.3.2 Restoration**

Implement moderate level of restoration.

#### **Fish Habitat Improvement**

- Replace 4 culverts.
- Install 5 graveled rock weirs per mile.
- Install 20 logs instream per mile.

#### **Vegetation Treatments**

##### **LSR Forest Habitat Restoration**

- Pre-commercial thin 862 acres of stands 10-30 years old; less than 8" DBH.
- Commercial thin 466 acres of mid-seral stands 30-80 years old; greater than 8" DBH.
- Treat stands with greater than 70 percent canopy closure.
- Leave CWD level of 5 percent ground cover per acre.
- Commercially remove CWD in stands with an excess of LSRA CWD levels.
- Leave all existing snags.

##### **Pine Habitat Restoration**

- Pre-commercial thin 16 acres of pine stands 10-30 years old; less than 8" DBH to encourage pine growth.
- Commercial removal in the following:
  - Thin 91 acres of mid-seral stands 30-80 years old;
  - Clear around pine trees greater than 24"
  - Thin on 686 acres of stands over 80 years old.

#### **Riparian Habitat Restoration**

- Perennial streams.
- Pre-commercial thin 225 acres of stands 10-30 years old; less than 8" DBH.
- Thin 134 acres of mid-seral stands 30-80 years old; greater than 8" DBH.
- Girdle trees where thinning would result in excessive fuel loading (greater than 20 tons per acre).
- Place some thinned trees into stream for fish habitat restoration.
- No commercial timber removal.

#### **Oak Woodlands and Meadows Restoration**

- Thin 1,554 acres; less than 8" DBH; underburn.
- Treat areas within the watershed, including the Timbered Rock Fire.

#### **Reforestation**

- Priority areas for planting:
  1. Pre-fire plantations.
  2. Severely burned areas with slopes greater than 65 percent.
  3. Stand-replacement areas greater than 5 acres.
  4. High priority riparian areas (high burn severity areas).
  5. Fifty foot strips along high burn severity fish streams.
- Plant at 10' x10' spacing using microsite emphasis (planting next to logs, stumps, etc.).
- Replant when stocking falls below 100 tpa.
- Plant mixed species.
- Avoid mulching, tubing, and shading until replanting.
- Remove competing brush around all the seedlings if stocking less than 250 tpa.
- Remove brush around one-half the trees if stocking greater than 250 tpa.

#### **Fuels Treatment Projects**

##### **Fuel Management Zones (FMZ)**

- Treat up to 1,300 acres along ridgelines; 400' outside the LSR and 200' within the LSR.
- Commercially thin 62 acres; 150' on both side of ridges in T33S, R1W, Sections 14 and 15.

##### **Owl Activity Center Underburns**

- Underburn 425 acres within 4 owl activity centers; 3 within the fire perimeter and 1 outside the fire perimeter but within the LSR.

##### **Fuels Treatment within West Branch Fire**

- Cut, pile, and burn fire killed trees < 8" within old burn.

## Wildlife Projects

### Eagle Nesting Habitat Enhancement

- Thin 50 acres; thin thickets of trees 10-30 years old around adjacent meadows to 12'-20' spacing; clear 10'-15' from dripline around existing larger overstory trees; less than 8" DBH.
- Leave larger cut trees on site.

### Log Piles for Wildlife Habitat

- Develop 6 sites.
- Logs 16" DBH or greater would be placed in piles 20' x 20' x 5'.

## Road Projects

### Road Reconstruction

- Reconstruct 2.6 miles of road.
- Add drainage structures and rock blankets.

### Road Stream-Crossing Upgrades

- Upgrade 11 sites at risk of fill failure.
- Replace existing culverts to pass 100-year storm event.
- Replace existing road fill with rock fill.

### Road Maintenance

- Maintain or improve 100 miles of road.

### Road Decommissioning

- Partial decommission of 2.5 miles of road.
- Full decommission of 32 miles of road.
- Close 21 miles of road with a gate or guardrail barricade.

### Seasonal Road Closures

- None.

### Pump Chance Restoration

- Restore 7 sites.

### Rock Quarry Closure and Rehabilitation

- Close and rehabilitate 5 quarries.

## 2.4.4 Alternative D

### LSR Salvage using DecAID Wood Advisor for Snags and CWD and Moderate Restoration

#### 2.4.4.1 Salvage

##### Area Salvage

- Salvage 820 acres.
- Salvage in stand replacement patches greater than 10 acres; less than 40 percent canopy closure.
- Use small patch clear cuts or group selection. Openings created would not exceed 20 acres.

- Use snag and CWD levels from DecAID Wood Advisor (see Appendix D).

- Roadside hazard acres within available area salvage units would contribute to the salvageable acres of those units.

- Harvest systems include:

- cable - 368 acres
- tractor - 112 acres
- helicopter - 321 acres
- bull-line - 19 acres

- Construct and rehabilitate 0.6 miles of temporary road.

- No net gain in permanent roads.

- Prohibit salvage in the following areas:

- Low and unburned areas; 40 percent or greater live canopy
- Riparian areas
- Patches less than 10 acres in size
- Selected owl activity centers in T32S, R1W, Section 1 and T33S, R1W, Section 1
- Retain all pre-fire CWD and snags.

#### Salvage of Roadside Hazard Trees

- Roadside salvage 1,064 acres.
- BLM would identify hazard trees along open roads or roads needed for temporary use for post-fire operations.
- BLM would identify only immediate hazards along proposed haul roads within riparian areas and owl activity centers.
- Salvage identified hazard trees along BLM-administered roads.
- Salvage previously felled hazard trees along Pacific Power powerline in T32S, R1E, Section 5, except for felled trees in riparian areas, needed to meet CWD requirements, or needed for logs for wildlife habitat project.
- Snags levels would be met by snags within adjacent area not identified as hazard trees.
- Leave pre-fire coarse woody debris.
- Hazard trees identified according to OSHA guidelines (see Appendix D for guidelines).
- Hazard trees within riparian areas and remaining owl activity centers with suitable habitat would be cut and left in place, except where trees or portions of trees fall within road prism.

#### 2.4.4.2 Restoration

Implement moderate level of restoration.

##### Fish Habitat Improvement

- Replace 4 culverts.
- Install 5 graveled rock weirs per mile.
- Install 20 logs instream per mile.

## Vegetation Treatments

### LSR Forest Habitat Restoration

- Pre-commercial thin 862 acres of stands 10-30 years old; less than 8" DBH.
- Commercial thin 466 acres of mid-seral stands 30-80 years old; greater than 8" DBH.
- Treat stands with greater than 70 percent canopy closure.
- Leave CWD level of 2 percent ground cover per acre.
- Commercially remove CWD in stands with an excess of DecAID levels.
- Leave all existing snags.

### Pine Habitat Restoration

- Pre-commercial thin 16 acres of pine stands 10-30 years old; less than 8" DBH to encourage pine growth.
- Commercial removal in the following:
  - Thin 91 acres of mid-seral stands 30-80 years old;
  - Clear around pine trees greater than 24"
  - Thin on 686 acres of stands over 80 years old.

### Riparian Habitat Restoration

- Perennial streams.
- Pre-commercial thin 225 acres of stands 10-30 years old; less than 8" DBH.
- Thin 134 acres of mid-seral stands 30-80 years old; greater than 8" DBH.
- Girdle trees where thinning would result in excessive fuel loading (greater than 20 tons per acre).
- Place some thinned trees into stream for fish habitat restoration.
- No commercial timber removal.

### Oak Woodlands and Meadows Restoration

- Thin 1,554 acres; less than 8" DBH; underburn.
- Treat areas within the watershed, including the Timbered Rock Fire.

### Reforestation

- Priority areas for planting:
  1. Pre-fire plantations.
  2. Severely burned areas with slopes greater than 65 percent.
  3. Stand replacement areas greater than 5 acres.
  4. High priority riparian areas (high burn severity areas).
  5. Fifty foot strips along high burn severity fish streams.
- Plant at 10' x10' spacing using microsite emphasis (planting next to logs, stumps, etc.).
- Replant when stocking falls below 100 tpa.
- Plant mixed species.
- Avoid mulching, tubing, and shading until replanting.
- Remove competing brush around all the seedlings if stocking less than 250 tpa.

- Remove brush around one-half the trees if stocking greater than 250 tpa.

## Fuels Treatment Projects

### Fuel Management Zone (FMZ)

- Treat up to 1,300 acres along ridgelines; 400' outside the LSR and 200' within the LSR.
- Commercially thin 62 acres; 150' on both side of ridges in T33S, R1W, Sections 14 and 15.

### Owl Activity Center Underburns

- Underburn 425 acres within 4 owl activity centers; 3 within the fire perimeter and 1 outside the fire perimeter but within the LSR.

### Fuels Treatment within West Branch Fire

- Cut, pile, and burn fire-killed trees <8" within old burn.

## Wildlife Projects

### Eagle Nesting Habitat Enhancement

- Thin 50 acres; thin thickets of trees 10-30 years old around adjacent meadows to 12-20' spacing; clear 10-15' from dripline around existing larger overstory trees; less than 8" DBH.
- Leave larger cut trees on site.

### Log Piles for Wildlife Habitat

- Develop 6 sites.
- Place logs 16" DBH or greater in piles 20' x 20' x 5'.

## Road Projects

### Road Reconstruction

- Reconstruct 2.6 miles of road.
- Add drainage structures and rock blankets.

### Road Stream-Crossing Upgrades

- Upgrade 11 sites at risk of fill failure.
- Replace existing culverts to pass 100-year storm event.
- Replace existing road fill with rock fill.

### Road Maintenance

- Maintain or improve 100 miles of road.

### Road Decommissioning

- Partial decommission of 2.5 miles of road.
- Full decommission of 32 miles of road.
- Close 21 miles of road with a gate or guardrail barricade.

### Seasonal Road Closures

- None.

## Pump Chance Restoration

- Restore 7 sites.

## Rock Quarry Closure and Rehabilitation

- Close and rehabilitate 5 quarries.

## 2.4.5 Alternative E

### High Level of Salvage and Extensive Restoration

#### 2.4.5.1 Salvage

Salvage would be considered in all burn severity levels. This would include areas where stand-replacement occurred as well as stands with scattered or clumps of fire-killed trees. Snag levels within the high and moderate severity areas would be based on levels suggested in study by Haggard and Gaines in 2001. This study concluded the highest diversity in cavity nesting species and highest number of nests were found in densities ranged from 6-14 snags per acre.

##### Area Salvage

- Salvage 3,269 acres.
- Salvage fire-killed trees in all stands (high/moderate/low/unburned severity areas).
- In high and moderate burn severity areas:  
Leave 8 snags per acre in Douglas-fir plant series.  
Leave 12 snags per acre in White fir plant series.  
Snags will be greater than 14" DBH.
- In low and very low burn severity areas, leave 4 snags per acre greater than 14" DBH.
- In all stands, leave minimum of 120 linear feet per acre of CWD per acre greater than 16" DBH.
- Harvest systems include
  - cable - 853 acres
  - tractor - 165 acres
  - helicopter - 2,063 acres
  - bull-line - 188 acres
- Construct and rehabilitate 1.5 miles of temporary road.
- No net increase in permanent roads.
- Prohibit salvage in riparian areas.

##### Salvage of Roadside Hazard Trees

- Roadside salvage 536 acres.
- BLM would identify hazard trees along open roads or roads needed for temporary use for post-fire operations.
- BLM would identify only immediate hazards along proposed haul roads within riparian areas and owl activity centers.
- Salvage previously felled hazard trees along Pacific Power powerline in T32S, R1E, Section 5, except for felled trees in riparian areas, needed to meet CWD requirements, or needed for logs for wildlife habitat project.
- Salvage identified hazard trees along BLM-administered roads.
- Snags levels would be met by snags within adjacent area

not identified as hazard trees.

- Leave pre-fire CWD.
- Hazard trees would be identified according to OSHA guidelines (see Appendix D for guidelines).
- Leave identified hazard trees within riparian areas and remaining owl activity centers with suitable habitat except where trees or portions of trees fall within road prism.

#### 2.4.5.2 Restoration

An extensive level of restoration projects would be implemented.

##### Fish Habitat Improvement

- Replace 4 culverts.
- Install 10 graveled rock weirs per mile.
- Install 25 instream logs per mile.

##### Vegetation Projects

###### LSR Forest Habitat Restoration

- Pre-commercial thin 1,102 acres of stands 10-30 years old; less than 8" diameter.
- Commercial thin 876 acres of mid-seral stands 30-80 years old; greater than 8" diameter.
- Treat stands with greater than 40 percent canopy closure.
- Commercial removal in stands where CWD levels in excess of 2.0 percent ground cover occurs (DecAID Advisor, see Appendix D).
- All pre-fire snags would be left.

###### Pine Habitat Restoration

- Pre-commercial thin 156 acres of stands 10-30 years old with pine; less than 8" diameter.
- Commercial removal in these stands:
  - Thin 162 acres of mid-seral stands 30-80 years old.
  - Clear around pine trees greater than 24" and thin on 1,687 acres of stands over 80 years old.

###### Riparian Habitat Restoration

- All streams.
- Pre-commercial thin 437 acres of stands 10-30 years; less than 8" DBH.
- Thin 613 acres of mid-seral stands 30-80 years old; greater than 8" DBH.
- Girdle trees where thinning results in excessive fuel loading (greater than 20 tons per acre).
- Place some thinned trees into stream for fish habitat restoration.
- No commercial removal.

###### Oak Woodlands and Meadow Restoration

- Thin 1,544 acres; less than 8" DBH; underburn.

## Chapter 2-Alternatives

- Treat areas within the watershed, including the Timbered Rock Fire.

### Reforestation

- Follow ESRP.
- Plant 6,000 acres.
- Plant hardwoods and brush species in Riparian Reserves.

### Fuels Treatment

#### Fuel Management Zones (FMZ)

- Treat up to 1,300 acres along ridgelines; 400' outside the LSR and 400' within the LSR.
- Commercially thin 35 acres; 150' on both sides of ridges in T33S, R1W, Sections 14 and 15.

#### Owl Activity Center Underburn

- Underburn 425 acres within 4 owl activity centers; 3 within the fire perimeter and 1 outside the fire perimeter but within the LSR.

#### Fuels Treatment within West Branch Fire

- Cut, pile, and burn fire killed trees <8" DBH within old burn.

### Wildlife Projects

#### Eagle Habitat Improvement

- Thin 50 acres to promote growth and development in large trees.
- Clear 10' to 15' from dripline around existing larger overstory trees.
- Thin thickets of younger trees around adjacent meadows to a spacing of 12'-20'.
- Thin trees less than 8" DBH.

#### Log Piles for Wildlife Habitat

- Develop 6 sites.
- Place logs 16" DBH or greater in piles about 20' x 20' x 5'.

### Road Projects

#### Road Reconstruction

- Reconstruct 2.6 miles of road.
- Add drainage structures and rock blankets.

#### Road Stream-Crossing Upgrades

- Upgrade 26 sites at risk of fill failure.
- Replace culverts to pass 100-year storm event.
- Replace existing road fill with rock fill.

#### Road Maintenance

- Maintain or improve 115 miles of road.

#### Road Decommissioning

- Partial decommission of 5.3 miles of road.
- Full decommission of 38 miles of road.
- Close 21 miles of roads with a gate or guardrail barricade.

### Seasonal Road Closures

- Approximately 114 miles of seasonal road closures on secondary and non-surfaced roads.
- Closure would be implemented between October 15 through April 30.

### Pump Chance Restoration

- Restore 7 sites.

### Rock Quarry Closure and Rehabilitation

- Close and rehabilitate 5 quarries.

## 2.4.6 Alternative F

### Salvage logging and restoration actions focused only within the Timbered Rock Fire perimeter.

[NOTE: This alternative is based on a report titled *Recommendations for Ecologically Sound Post-Fire Salvage Management and Other Post-Fire Treatments on Federal Lands in the West* (Beschta, et al. 1995) and offers a number of guidelines regarding salvage of fire-killed trees and post-fire rehabilitation projects. This alternative represents an interpretation and application of some of those guidelines.]

#### 2.4.6.1 Salvage

##### Area Salvage

- Salvage 213 acres.
- Salvage pockets of dead trees between 3-10 acres in size located in green stands; leave a minimum of 2 acres untouched within each pocket.
- Snags and CWD levels provided by unsalvaged areas.
- Harvest systems include:
  - cable - 46 acres
  - tractor - 29 acres
  - helicopter - 122 acres
  - bull-line - 16 acres
- No net increase in permanent roads.
- No salvage in the following areas:
  1. Clumps of dead trees less than 3 acres or greater than 10 acres
  2. High and moderate burn severity areas
  3. Erosive sites or sites where accelerated erosion is possible
  4. Fragile soils
  5. Steep slopes
  6. Riparian areas

##### Salvage of Roadside Hazard Trees

- Roadside salvage 1,182 acres.
- BLM would identify hazard trees along open roads or roads needed for temporary use for post-fire operations

- BLM would identify only immediate hazards along proposed haul roads within riparian areas and owl activity centers.
- Salvage previously felled hazard trees along Pacific Power powerline in T32S, R1E, Section 5, except for felled trees in riparian areas, needed to meet CWD requirements, or needed for logs for wildlife habitat project.
- Salvage of hazard trees along BLM-administered roads.
- Snags levels would be met by snags within adjacent area not identified as hazard trees.
- Only felled hazard trees would be salvaged; pre-fire coarse woody debris would be retained.
- Hazard trees identified according to OSHA guidelines (see Appendix D for guidelines).
- Hazard trees identified within riparian areas and remaining owl activity centers with suitable habitat would be left in place, except where trees or portions of trees fall within road prism.

## 2.4.6.2 Restoration

The Beschta, et al. report does not address actions outside of a burned area. As a result, no LSR restoration actions are proposed. Restoration within the burn area would be as follows:

### Fish Habitat Improvement

- Replace 4 culverts.
- Install 3 graveled rock weirs per mile.
- Install 25 instream logs per mile.

### Vegetation Projects

#### LSR Habitat Restoration

- None.

#### Pine Habitat Restoration

- None.

#### Riparian Habitat Restoration

- None.

#### Oak Woodlands and Meadow Restoration

- Within fire perimeter, thin 540 acres; less than 8" DBH; underburn.

#### Reforestation

- Delay planting or seeding for 3 years to determine if natural regeneration is occurring.
- Plant in riparian areas and on slopes greater than 65 percent.
- 10'x10' spacing.

### Fuels Treatments

#### Fuel Modification Zones (FMZ)

- Treat 500 acres of ridgelines within fire perimeter; 200' outside the LSR and 200' within the LSR.

### Owl Activity Center Underburns

- Underburn 300 acres in 3 owl activity centers within the Timbered Rock Fire.

### Fuels Treatment within West Branch Fire

- Cut, pile, and burn fire-killed trees < 8" DBH within old burn.

### Wildlife Projects

#### Eagle Habitat Improvement

- None.

#### Log Piles for Wildlife Habitat

- Develop 6 sites.
- Place logs 16" DBH or greater in piles about 20'x20'x5'.

### Road Projects (within fire perimeter)

#### Road Reconstruction

- Reconstruct 2.6 miles of road.
- Add draining structures and rock blankets.

#### Road Stream-Crossing Upgrades

- Upgrade 26 sites at risk of fill failure.
- Replace culverts to pass 100-year storm event.
- Replace existing road fill with rock fill.

#### Road Maintenance

- Maintain or improve 68 miles of road.

#### Road Decommissioning

- Partial decommission of 1.4 miles of road.
- Full decommission of 15.1 miles of road.
- Close 14 miles of roads with a gate or guardrail barricade.

#### Seasonal Road Closures

- None.

### Pump Chance Restoration

- Restore 3 sites.

### Rock quarry closure and rehabilitation

- Restore and rehabilitate 5 quarries.

## 2.4.7 Alternative G

### (Preferred Alternative)

#### Salvage Based on Research Questions and Salvage in Stand Replacement Units greater than 10 Acres; Moderate Restoration (see Map 2-6f)

##### 2.4.7.1 Salvage

Salvage would be considered in stand replacement (high and moderate burn severity) areas greater than 10 acres and less than 40 percent canopy closure. Two types of area salvage proposed – “research units” and “remaining area.” Salvage in research units would be based on responding to research questions revolving around the influences of post-fire salvage and salvage intensities on wildlife species. Snag levels in research units would be based on study design. Snag levels in remaining area salvage units would be based on DecAID wood advisor and other local and regional references (see Appendix D).

##### Area Salvage

###### 1. Research Units

Salvage would be based on responding to research questions revolving around the influences of post-fire salvage and salvage intensities on wildlife species. Snag levels in research units would be based on study design.

- Salvage 282 acres.
- 12 units included in research proposal.
- Units are 30 acres or greater.
- Three treatments levels implemented:
  1. Control – no salvage activity.
  2. Moderate Salvage – 30% unsalvaged; 70% salvaged leaving 6 snags per acre greater than 20" DBH.
  3. Heavy Salvage – entire site salvaged leaving 6 snags per acre greater than 20" DBH.
- Salvage would occur in approximately 11 acres of Riparian Reserve.
- Harvest systems include:
  - cable - 136 acres
  - tractor - 7 acres
  - helicopter - 139 acres

###### 2. Remaining Area Salvage

Salvage outside of research units, “remaining area,” would consider salvaging of stand replacement (high and moderate burn severity) areas greater than 10 acres and less than 40 percent canopy closure. Snag levels in these units would be based on DecAID Wood Advisor and other local and regional references (see Appendix D).

- Salvage 679 acres in units greater than 10 acres.
- Use small patch clear cuts or group selection. Openings created would not exceed 20 acres.

- Snags would be retained in reserved area outside of cut patches
- Leave average of 8 snags per acre in Douglas-fir plant series.
- Leave average of 12 snags per acre in White fir plant series.
- Snags will be greater than 14" DBH.
- Harvest systems include:
  - cable - 266 acres
  - tractor - 106 acres
  - helicopter - 272 acres
  - bull-line - 35 acres
- Construct and rehabilitate 0.9 miles of temporary road.
- No new permanent roads.
- Prohibit salvage in riparian areas.

##### Salvage of Roadside Hazard Trees

- Roadside salvage 1,188 acres.
- BLM would identify hazard trees along open roads or roads needed for temporary use for post-fire operations.
- BLM would identify only immediate hazards along proposed haul roads within riparian areas and owl activity centers.
- Salvage previously felled hazard trees along Pacific Power powerline in T32S, R1E, Section 5, except for felled trees in riparian areas, needed to meet CWD requirements, or needed for logs for wildlife habitat project.
- Salvage hazard trees along BLM-administered roads.
- Snag levels would be met by snags within adjacent area not identified as hazard trees.
- Pre-fire coarse woody debris would be retained.
- Hazard trees identified according to OSHA guidelines (see Appendix D for guidelines).
- Hazard trees identified within riparian areas and remaining owl activity centers with suitable habitat would be left in place, except where trees or portions of trees fall within road prism.

##### 2.4.7.2 Restoration

Implement moderate level of restoration.

##### Fish Habitat Improvement

- Replace 4 culverts.
- Install 5 graveled rock weirs per mile.
- Install 20 instream logs per mile.

##### Vegetation Projects

###### LSR Forest Habitat Restoration

- Pre-commercial thin 862 acres of stands 10-30 years old; less than 8" DBH.

- Commercial thin 466 acres of mid-seral stands 30-80 years old; greater than 8" DBH
- Treat stands greater than 70 percent canopy closure.
- Commercial removal in stands in excess of LSRA CWD retention levels.
- Leave all pre-fire snags.

### Pine Habitat Restoration

- Pre-commercial thin 16 acres of young pine stands; cut trees less than 8" DBH to encourage pine growth.
- Commercial removal in the following:
  - Thin 91 acres of mid-seral stands 30-80 years old;
  - Clear around pine trees greater than 24" DBH.
  - Thin on 686 acres of stands over 80 years old.

### Riparian Habitat Restoration

- Perennial streams.
- Pre-commercial thin 225 acres of stands 10-30 years; less than 8" DBH.
- Thin 134 acres of mid-seral stands 30-80 years old; greater than 8" DBH; no commercial removal.
- Girdle trees where thinning would result in excessive fuel loading (greater than 20 tons per acre).
- Place some thinned trees into stream for fish habitat restoration.

### Oak Woodland and Meadow Restoration

- Thin 1,544 acres; less than 8" DBH; underburn.
- Treat areas within and outside the fire perimeter.

### Reforestation

- Priority areas for planting:
  1. Pre-fire plantations.
  2. Severely burned areas with slopes greater than 65 percent.
  3. Stand replacement areas greater than 5 acres.
  4. High priority riparian areas (high burn severity areas).
  5. Fifty foot strips along high burn severity fish streams.
- Plant at 10' x10' spacing with microsite emphasis (planting next to logs, stumps, etc.).
- Replant when stocking falls below 100 tpa.
- Plant mixed species.
- Avoid mulching, tubing, and shading until replanting.
- If stocking less than 250 tpa, remove competing brush around all the seedlings; if stocking greater than 250 tpa, remove brush around one-half the trees.
- Implement Timbered Rock Mixed-Species Reforestation Study.

### Fuels Treatments

#### Fuel Modification Zones (FMZ)

- Treat 1,300 acres along ridgelines; 400' outside the LSR and 200' within the LSR.

- Commercial thin 62 acres; 150' on both side of ridges in T33S, R1W, Sections 14 and 15.

### Owl Activity Center Underburns

- Underburn 425 acres within 4 owl activity centers; 3 within the fire perimeter and 1 outside the fire perimeter but within the LSR.

### Fuels Treatment within West Branch Fire

- Cut, pile, and burn fire killed trees <8" DBH within old burn.

### Wildlife Projects

#### Eagle Habitat Improvement

- Thin 50 acres to promote growth and development in large trees
- Clear 10'-15' from dripline around existing larger overstory trees.
- Thin thickets of younger trees around adjacent meadows to a spacing of 12'-20'.
- Thin trees less than 8" diameter

#### Log Piles for Wildlife Habitat

- Develop 6 sites.
- Place logs 16" DBH or greater in piles about 20'x20'x5'.

### Road Projects

#### Road Reconstruction

- Reconstruct 2.6 miles of road.
- Add drainage structures and rock blankets.

#### Road Stream-Crossing Upgrades

- 11 sites at risk of fill failure.
- Replace culverts to pass 100-year storm event.
- Replace existing road fill with rock fill.

#### Road Maintenance

- Maintain or improve 100 miles of road.

#### Road Decommissioning

- Partial decommission of 2.5 miles of road.
- Full decommission of 32 miles of road.
- Close 21 miles of road with a gate or guardrail barricade.

#### Seasonal Road Closures

- Approximately 114 miles of seasonal road closures on secondary and non-surfaced roads.
- Closure would be implemented between October 15 through April 30.

### Pump Chance Restoration

- Restore 7 sites.

### Rock Quarry Closure and Rehabilitation

- Close and rehabilitate 5 quarries.

## 2.5 Range of Reasonable Alternatives

CEQ Regulations (40 CFR 1502.14) require that a reasonable range of alternatives be proposed and the effects of implementing those actions be evaluated. A range of alternatives was obtained by combining various intensities of salvage and late-successional forest restoration projects into alternatives.

By combining six approaches to economic recovery of fire-killed trees (salvage) with four intensity levels for restoration projects, six action alternatives were developed. The six action alternatives, plus the No Action Alternative, resulted in a total of seven different alternatives. Variations between the action alternatives focus primarily on the intensity of treatments rather than the types of treatments.

Options are also presented for reforestation consistent with overall restoration intensity levels. Alternatives A and E follow the ESRP reforestation guidelines. Alternatives B, C, D, and G more closely follow LSR objectives as opposed to reforestation on Matrix lands; i.e. fewer follow-up silviculture treatments, and greater species diversity. Alternative F follows the report from Beschta, et al.

Proposed restoration projects were derived from the South Cascades LSRA, the Elk Creek WA, or developed during preparation of this EIS.

The alternatives for area salvage range from no salvage (Alternatives A and B) to highest level of salvage in Alternative E. Salvage guidance from the NFP for LSRs states “Levels will be ‘typical’ and will not require retention of all material where it is highly concentrated, or too small to contribute to coarse woody debris over the long timeframes discussed.” (USDA and USDI 1994b, C-15). However, the NFP does not define “typical” levels. The No Action Alternative (no salvage) and guidance from the report by Beschta, et al. provide very conservative approaches to salvage in an LSR. The South Cascades LSRA defines typical levels of snags and CWD using a different conservative approach (USDI and USDA 1998, 173).

Another level of possible salvage is proposed using an advisory system (from the LSR Working Group) called “DecAID.” A maximum level of salvage is proposed using a higher level of snags and CWD retention than required on Matrix lands. This is lower than what is recommended in LSRA guidance. Finally, in response to numerous questions raised about salvage, a “research alternative” was developed through coordination with a group of Oregon State University (OSU) natural resource scientists. All of the salvage alternatives analyze a higher level of snags and CWD than found in guidelines from State of Oregon Forest Practices Act, which applies to private lands, or guidelines

for Matrix lands from the NFP. Additional guidelines for developing salvage alternatives are described in Appendix D.

As stated in the LSRA, the approach presented for “area salvage” is a conservative approach to salvage (USDA and USDI 1998, 173). The report from Beschta, et al., represents the approach producing the least amount of salvage, other than no salvage. The decision maker would not have a reasonable range of alternatives from which to choose if guidelines from the South Cascades LSR Assessment were used as the maximum amount of salvage.

### 2.5.1 Alternatives Considered but Eliminated from Detailed Analysis

During the review of internal and public issues, and development of alternatives, several variations of alternatives were considered by the interdisciplinary team. Of the various alternatives considered, three alternatives were developed but eliminated from detailed study after closer assessment.

#### 2.5.1.1 Roadside Hazard Tree Removal

The importance of public land user safety and the removal of hazard trees along open roads was discussed. The team decided it was not necessary to analyze removal of hazard trees as a stand-alone alternative. Therefore, this alternative was incorporated into all the action alternatives.

#### 2.5.1.2 Do Not Delay Harvest of Dead Trees

Based on public comment, the BLM should proceed with the salvage of fire-killed trees. Many adjacent landowners in the Elk Creek Watershed proposed removing the fire-killed trees immediately in order to recover the value of what was burned and reduce the risk of another fire in the future. There would be less loss of salvageable material due to decay and reforestation efforts could begin sooner. BLM must use the required decision-making process, including preparation of an environmental document and public participation under NEPA for BLM-administered lands. Following these rules and regulations prevents the BLM from immediately implementing an alternative such as this. Therefore, this alternative was dropped from consideration.

#### 2.5.1.3 Consideration of Recommendations for Ecologically Sound Post-Fire Salvage Management and Other Post-fire Treatments on Federal Lands in the West (Beschta, et al. 1995)

The recommendations in this report could not be totally implemented as written. To the extent possible, they were considered and applied in Alternative F. The

recommendation to leave all trees greater than 20" DBH was not adopted. Objectives of this EIS are economic recovery as well as LSR restoration. Due to decay, salvage of fire-killed trees 16" DBH or less is not economical in most cases after two years. After three years, these trees are basically unsalvageable. After five years, trees less than 28" DBH lose nearly 40 percent of volume and only the largest trees are consistently salvageable. Due to reduced harvest efficiency, the potential for economic benefit from timber salvage would be lost within 3 years for areas where trees less than 28" DBH are common. By the third year, reassessment of these areas would be required to determine the feasibility of salvage. Areas of consistently larger trees (28" DBH or greater) could remain salvageable for 10 to 15 years but volume losses from decay and drying would continue to occur.

Another recommendation from this report was to allow natural recovery. Human intervention should not be permitted unless and until it is determined that natural recovery process are not occurring. An Emergency Stabilization/Rehabilitation Plan (ESRP) was developed immediately after the fire. The ESRP recommended replanting the plantations burned at high severity. In spring 2003, 1,000 acres in old plantations were replanted. Therefore, these recommendations were not adopted in Alternative F.

## 2.6 Comparison of Alternatives

Table 2-1 presents in detail the levels of salvage and restoration treatments proposed. More detailed descriptions of the projects can be found in the alternative descriptions in this chapter or in Appendices D and E. Treatment measurements (acres/miles/etc.) are estimates for analytical purposes and actual treatments will vary.

## 2.7 Summary Comparison of the Effects of the Alternatives

Table 2-2 is a summary of the effects of implementing the alternatives. This summarizes effects on resources and illustrates how the alternatives meet project objectives.

## 2.8 Cumulative Effects Analysis Summary

Table 2-3 summarizes the important cumulative effects anticipated within the area. Cumulative effects analyses are particularly important in this EIS because of the effects of the wildfire, the anticipated effects of the proposed alternatives, the effects of actions on adjacent industrial forestlands, and the effects of other reasonably foreseeable future actions within the geographic area.

## 2.9 Stand-Replacement Trends and Consequences

Table 2-4 projects the anticipated trends and consequences in salvaged and unsalvaged stand replacement areas. Stand-replacement areas are those areas where the fire resulted in less than 40 percent live canopy. The table shows the anticipated development of these stands in 15, 50, and 80 years and the predicted influences they would have on other resource values over time. It projects anticipated development of these stands towards meeting the LSRA Desired Future Conditions described in Appendix B and in Management Recommendations from the Elk Creek Watershed Analysis.

## 2.10 Trends and Consequences of Restoration Projects

Table 2-5 projects the anticipated trends and consequences of the proposed restoration projects. The table shows anticipated developments within the watershed in 5 and 50 years resulting from these proposed projects. It also shows predicted influences these projects would have on other resource values over time. It projects anticipated direction these projects would provide in meeting the LSRA Desired Future Conditions described in Appendix B and in Management Recommendations from the Elk Creek Watershed Analysis.

Proposed Projects		Salvage	Alternative A – No Action – Continuation of Current Management	Alternative B – No Salvage; Focused Restoration	Alternative C – LSRA Salvage; Moderate Restoration	Alternative D – LSR Salvage with DecAID; Moderate Restoration	Alternative E – High Salvage; Extensive Restoration	Alternative F – Salvage based on Report by Beschta, et al.; Focused Restoration in Fire Area Only	Alternative G – Salvage based on Research; Moderate Restoration

Table 2-2. Summary of the Effects of the Alternatives

**Table 2-3. Cumulative Effects Analysis Summary**

Issue	Past Actions	Timbered Rock Fire and Fire Suppression Actions	Proposed Actions Under the Preferred Alternative	Reasonable Foreseeable Future Actions	Cumulative Effects
Timber Management	<ul style="list-style-type: none"> <li>• Checkerboard ownership pattern creates mosaic of seral stages</li> <li>• Both industrial and public lands managed for timber production</li> <li>• Numerous roads built to facilitate timber management</li> <li>• Last timber sale on public lands was in late 1980s</li> <li>• Public lands designated an LSR in 1994 and management focus switched to protecting or accelerating LSOG forest conditions</li> </ul>	<ul style="list-style-type: none"> <li>• Fire returned areas of high and moderate burn severity to early seral.</li> <li>• Areas burned with low or very low severity will return to pre-fire conditions within 2-10 years</li> </ul>	<ul style="list-style-type: none"> <li>• Public lands administered by BLM (and USFS) managed for late-successional forest conditions consistent with NFP and Medford District RMP</li> </ul>	<ul style="list-style-type: none"> <li>• Industrial forestlands managed intensively at short rotations (approximately 80 years)</li> <li>• Public lands administered by BLM and FS managed to protect and/or enhance late-successional forest conditions within the Elk Creek Watershed</li> <li>• Public lands in adjacent forest watersheds managed as Matrix, emphasis on timber production</li> </ul>	<ul style="list-style-type: none"> <li>• In the long-term, public lands managed by BLM and FS provide for late-successional forest conditions</li> <li>• Interspersed with BLM-administered lands are young and mid-seral forest stands on industrial forestlands</li> <li>• Salvage actions undertaken consistent with established LSR guidelines</li> <li>• Industrial forestlands salvaged consistent with OFPA guidelines</li> </ul>
Salvage		<ul style="list-style-type: none"> <li>• Actions taken consistent with past management direction, leaving fewer snags or CWD compared to existing direction</li> </ul>	<ul style="list-style-type: none"> <li>• N/A</li> </ul>	<ul style="list-style-type: none"> <li>• Salvage actions undertaken consistent with established LSR guidelines</li> </ul>	<ul style="list-style-type: none"> <li>• Salvage actions undertaken consistent with established LSR guidelines</li> <li>• Industrial forestlands salvaged consistent with OFPA guidelines</li> </ul>

Wildfires	<ul style="list-style-type: none"> <li>Fire suppression began about 1910</li> <li>Large fires include:           <ul style="list-style-type: none"> <li>1910 Buzzard Rock Fire</li> <li>1910 Needle Rock Fire</li> <li>1971 Elk Horn Peak Fire</li> <li>1972 West Branch Fire</li> <li>1987 Burnt Peak Fire</li> <li>2002 Timbered Rock Fire</li> </ul> </li> <li>Fuels treatments have started within the watershed</li> <li>Numerous small fires occurred and were suppressed</li> <li>Fire exclusion has increased biomass</li> </ul>	<ul style="list-style-type: none"> <li>Fire reduced fuel loadings for the short-term within fire perimeter</li> <li>Outside fire perimeter, fuel loading remains high</li> <li>Fuels treatments would reduce fuel loadings</li> <li>Proposed fuels treatments could potentially reduce large fire size into 5,000- to 7,000-acre blocks</li> <li>Existing fuels treatments would be expanded outside fire perimeter</li> </ul>	<ul style="list-style-type: none"> <li>Wildfires continue to occur</li> <li>Aggressive fire suppression will continue to occur based on proximity to private land</li> <li>Maintain fuels treatments to reduce flammability</li> <li>Short-term, fuel conditions are present for large fires to occur given favorable weather conditions</li> <li>Long-term, probability for large fires to occur would decrease</li> <li>Increased protection to Wildland Urban Interface</li> </ul>	<ul style="list-style-type: none"> <li>Potential for major reburn will exist after 15 to 20 years</li> <li>FMZs and thinnings would increase fire fighter safety and enhance control efforts</li> <li>• Short-term, fuel conditions are present for large fires to occur given favorable weather conditions</li> <li>• Long-term, probability for large fires to occur would decrease</li> <li>• Increased protection to Wildland Urban Interface</li> <li>• Seed from cones on fire-killed trees and adjacent live trees would help regenerate conifers</li> <li>• Fire-scorched hardwoods would repropout</li> <li>• Stocking levels &gt;100 tpa would be reestablished on about 3,100 acres of BLM-administered land</li> <li>• Fire-killed openings &lt;5 acres and low/very low burn severity areas would rely on natural seedling regeneration</li> <li>• Shrub component would likely be higher than past plantations</li> </ul>
Reforestation				

Table 2-3. Cumulative Effects Analysis Summary

**Table 2-3. Cumulative Effects Analysis Summary**

Issue	Past Actions	Timbered Rock Fire and Fire Suppression Actions	Proposed Actions Under the Preferred Alternative	Reasonable Foreseeable Future Actions	Cumulative Effects
CWD and Snags	<ul style="list-style-type: none"> <li>Exclusion of fire has allowed small diameter woody debris to increase</li> <li>Some large diameter downed wood and snags have been removed in past harvest</li> <li>Fire exclusion has altered natural decay processes</li> </ul>	<ul style="list-style-type: none"> <li>Fire created more small diameter CWD than previously existed</li> <li>Large diameter wood and snags was created by the fire</li> </ul>	<ul style="list-style-type: none"> <li>Retains most small diameter trees killed in the fire</li> <li>Retains 6 tpa in research units and 8-12 large diameter snags per acre outside of research units</li> <li>Meets or exceeds snag and CWD retention levels suggested by DecAID Wood Advisor at 30% and 50% levels</li> <li>In Riparian Reserves, loss of future CWD on 14 acres harvested in research units</li> </ul>	<ul style="list-style-type: none"> <li>Harvest of up to 6,000 acres of private industrial forest land killed by the fire</li> </ul>	<ul style="list-style-type: none"> <li>Reduction in CWD and snag levels on private timberland consistent with OFPA</li> <li>Retention of snags and CWD on BLM-administered land consistent with levels suggested by DecAID Wood Advisor</li> <li>Most fire-killed trees under 16" DBH not merchantable and retained</li> </ul>
LSR Habitat					<ul style="list-style-type: none"> <li>Management actions in adjacent watersheds and on BLM and FS Matrix lands reduce late-successional habitat</li> <li>FMZs maintained with open understory</li> <li>Late-successional habitat conditions improve in Riparian Reserves, owl cores, and in LSRs</li> <li>Silvicultural treatments applied to young and mid-seral stands to accelerate late-successional forest conditions</li> <li>Reforestation and snag retention would help produce future late-successional habitat</li> </ul>

<p><b>Special Habitat:</b> Riparian Vegetation</p> <ul style="list-style-type: none"> <li>• More early and mid-seral riparian vegetation due to past timber harvest</li> <li>• Reduced species and structural diversity in plantations due to even-spaced planting and thinning</li> <li>• Fuels build-up due to fire exclusion</li> </ul>	<ul style="list-style-type: none"> <li>• Loss of some late-successional riparian vegetation</li> <li>• Minor amount of riparian vegetation cut along roads during fire suppression activities</li> </ul>	<ul style="list-style-type: none"> <li>• High burn severity riparian areas replanted with conifers and hardwoods</li> <li>• Late-successional characteristics accelerated in early and mid-seral riparian stands.</li> </ul>	<ul style="list-style-type: none"> <li>• Development of late-successional habitat accelerated in thinned Riparian Reserves</li> <li>• Planting accelerates tree establishment in riparian areas burned at high severity or impacted during fire suppression activities</li> </ul>	<ul style="list-style-type: none"> <li>• Riparian vegetation improved on BLM-administered land, but at watershed-level riparian vegetation may not be functioning at optimal conditions due to checkerboard ownership</li> </ul>
<p><b>Special Habitat:</b> Oak Woodlands and Meadows</p> <ul style="list-style-type: none"> <li>• Altered and loss of habitats due to past human activities</li> <li>• Fuel build up and loss of fire-dependent native vegetation due to fire exclusion</li> </ul>	<ul style="list-style-type: none"> <li>• Some increased risk of exotic plant invasion from fire suppression activities and in areas burned at high severity</li> <li>• Fuel loads reduced and fire reintroduced in oak woodlands and meadows within the fire perimeter</li> </ul>	<ul style="list-style-type: none"> <li>• Oak woodlands and meadows inside and outside the fire perimeter restored and maintained</li> <li>• Wildfires likely to continue</li> </ul>	<ul style="list-style-type: none"> <li>• Oak woodlands and meadows maintained on BLM-administered land</li> <li>• Wildfires likely to continue</li> </ul>	<ul style="list-style-type: none"> <li>• Oak woodlands and meadows maintained and more fire-resilient on BLM-administered land</li> </ul>
<p><b>Special Status Plants</b></p>	<ul style="list-style-type: none"> <li>• Altered and loss of habitat and Special Status plant populations due to past human activities within this and adjacent watersheds</li> </ul>	<ul style="list-style-type: none"> <li>• Slight chance that Special Status plants impacted by fire suppression activities</li> <li>• Some Special Status plants possibly impacted in high and moderate burn severity areas</li> <li>• Decrease in habitat for late-successional associated species; increase for earlier seral species</li> </ul>	<ul style="list-style-type: none"> <li>• Continued logging and road building on private lands</li> <li>• Potential increase in noxious weeds</li> <li>• Increased habitat diversity and accelerated late-successional conditions from habitat enhancement projects</li> </ul>	<ul style="list-style-type: none"> <li>• Habitat diversity and suitability for Special Status plants increased on BLM-administered land due to natural recovery and habitat enhancement projects</li> </ul>

Table 2-3. Cumulative Effects Analysis Summary

**Table 2-3. Cumulative Effects Analysis Summary**

Issue	Past Actions	Timbered Rock Fire and Fire Suppression Actions	Proposed Actions Under the Preferred Alternative	Reasonable Foreseeable Future Actions	Cumulative Effects
Road Density	<ul style="list-style-type: none"> <li>Numerous roads created for agricultural, residential, and timber management purposes</li> <li>High road density within watershed</li> </ul>	<ul style="list-style-type: none"> <li>Slight increase resulting from opening old roads previously closed</li> </ul>	<ul style="list-style-type: none"> <li>Road density decreases on BLM-administered land and within entire watershed</li> <li>Seasonal closures minimize traffic during wet season</li> </ul>	<ul style="list-style-type: none"> <li>Roads remain within Elk Creek valley bottom and major drainages</li> <li>Numerous roads on BLM and industrial forestland either closed, improved, or decommissioned</li> <li>Long-term maintenance decreases</li> </ul>	<ul style="list-style-type: none"> <li>Decrease in total miles of roads</li> <li>Decrease in miles of natural surface roads</li> <li>Decrease in miles of roads within riparian areas</li> <li>Long-term decrease as fewer roads needed for timber management on both public and industrial forestland</li> </ul>
Soil	<ul style="list-style-type: none"> <li>Large increase in erosion over natural background rates</li> <li>Recently decreased erosion rates with improved forest practices</li> </ul>	<ul style="list-style-type: none"> <li>Soil disturbance from fire-line construction</li> <li>Fire-related erosion greatly increased</li> <li>Severe reduction in soil organisms in high burn severity areas</li> </ul>	<ul style="list-style-type: none"> <li>Decreased road-related erosion</li> <li>Moderate short-term increased erosion from salvage</li> <li>Maximum 12 percent compaction and displacement from tractor-yarded acres</li> <li>144 acres returned to vegetation from decommissioned roads</li> </ul>	<ul style="list-style-type: none"> <li>Decreased erosion as fire area revegetates</li> </ul>	<ul style="list-style-type: none"> <li>Moderate short-term increase in erosion rates</li> <li>Reduced soil productivity from loss of organic material due to fire and whole tree yarding</li> <li>Slight long-term negative effect to soil productivity within fire area on BLM-administered land</li> <li>Beneficial effect in areas underburned due to increased nutrient availability</li> <li>Short-term benefit to productivity from immediate input of tops, limbs, and sawdust</li> </ul>

Delivery of Sediment to Streams	<ul style="list-style-type: none"> <li>Increased over background levels due to road building and logging</li> <li>Roads are the major source of sediment</li> </ul>	<ul style="list-style-type: none"> <li>Due to the fire, measurable increase over pre-fire levels during first year, with levels tapering off each consecutive year as vegetation recovers</li> </ul>	<ul style="list-style-type: none"> <li>Slight increase above existing condition from salvage and road-related projects</li> <li>Large reduction of fine sediment delivery from some roads</li> </ul>	<ul style="list-style-type: none"> <li>Road restoration actions on BLM-administered land would reduce sediment delivery</li> <li>Seasonal road closures on public and industrial forestland would reduce sediment delivery</li> </ul>	<ul style="list-style-type: none"> <li>Increased above background in short-term from road building, logging, fire suppression, salvage, and restoration</li> <li>Decreased in long-term from road improvements, decommissioning, and closure, but still above background levels</li> </ul>
Stream Temperature	<ul style="list-style-type: none"> <li>Increased over background levels due to agriculture, logging, and road building</li> </ul>	<ul style="list-style-type: none"> <li>Increased temperature from loss of some streamside canopy cover during fire</li> </ul>	<ul style="list-style-type: none"> <li>Actions protect and maintain stream buffers</li> </ul>	<ul style="list-style-type: none"> <li>Harvest on industrial forestland maintains stream buffers consistent with OFPA</li> <li>Increased stream shading due to recovering riparian areas would reduce stream temperatures</li> </ul>	<ul style="list-style-type: none"> <li>Increased above background level from past actions and wildfire</li> <li>Pre-fire temperature levels reached in long-term after vegetation recovers</li> </ul>
Mass Wasting	<ul style="list-style-type: none"> <li>Increased substantially over background levels due to road building, logging, and wildfires</li> <li>Roads constructed on mid-slope in steep terrain have the greatest failure rates</li> </ul>	<ul style="list-style-type: none"> <li>Greatly increased over next 10 years within fire perimeter</li> <li>Steep uplands and mid-slope roads in the high and moderate burn severity areas are at the highest risk</li> </ul>	<ul style="list-style-type: none"> <li>Focused restoration of at-risk roads would measurably reduce the incidence of mass wasting from roads on BLM lands</li> <li>Reforestation would improve slope stability and reduce effects of mass wasting in the long-term</li> </ul>	<ul style="list-style-type: none"> <li>Likely to be an equal or greater number of potential events within the fire on industrial forest land as on BLM-administered land</li> <li>Treat some road fills to reduce delivery of sediment to streams</li> </ul>	<ul style="list-style-type: none"> <li>Mass wasting from roads and uplands may decrease to pre-fire levels after 10+ years, however, could remain higher near roads due to reduced maintenance</li> <li>Implementing the proposed road restoration action on BLM-administered lands would decrease incidence of mass wasting along roads</li> </ul>
Coho Salmon	<ul style="list-style-type: none"> <li>Removal of large woody debris resulted in low habitat complexity and limited insect production</li> </ul>	<ul style="list-style-type: none"> <li>Slight increase in LWD</li> <li>Continued low habitat complexity</li> </ul>	<ul style="list-style-type: none"> <li>Improved habitat complexity</li> </ul>	<ul style="list-style-type: none"> <li>Improved habitat complexity</li> </ul>	<ul style="list-style-type: none"> <li>Improved fish populations and habitat in the short-term</li> <li>Substantial decrease of fine sediment in streams</li> </ul>

Table 2-3. Cumulative Effects Analysis Summary

**Table 2-3. Cumulative Effects Analysis Summary**

Issue	Past Actions	Timbered Rock Fire and Fire Suppression Actions	Proposed Actions Under the Preferred Alternative	Reasonable Foreseeable Future Actions	Cumulative Effects
Northern Spotted Owl	<ul style="list-style-type: none"> <li>Habitat on BLM and FS lands has been improving since LSR designation in 1994</li> <li>Owl populations slightly declining due to habitat alteration</li> </ul>	<ul style="list-style-type: none"> <li>Major reduction in the amount of suitable habitat</li> <li>Major reduction in the probability of successful nesting</li> <li>Salvage would not alter existing suitable habitat</li> </ul>	<ul style="list-style-type: none"> <li>Unknown level of use of burned stands by spotted owls</li> <li>Unknown level of risk from salvaging dead stands within <math>\frac{1}{2}</math> mile of historic activity centers</li> </ul>	<ul style="list-style-type: none"> <li>Harvest on intermingled industrial lands could have additional effects on foraging</li> <li>Anticipate 11 of 13 sites active pre-fire will remain occupied</li> <li>Salvage on intermingled industrial lands could have additional effects</li> <li>Owl cores and Riparian Reserves in adjacent watershed will provide connectivity between LSRs</li> </ul>	<ul style="list-style-type: none"> <li>Suitable habitat on Matrix lands in adjacent lands continues to be logged</li> <li>Increase in suitable spotted owl habitat as LSR characteristics return over long period of time</li> <li>Salvage on intermingled industrial lands could have additional effects</li> <li>Bark beetle populations would rise in the first 2 years after the fire and likely infest adjacent green trees, but would be localized and decrease to more normal levels within 3-4 years</li> <li>Wood borer populations would likely rise and remain higher than normal as long as downed trees remain sound</li> </ul>
Insect Outbreak	<ul style="list-style-type: none"> <li>Bark beetle and wood borer populations were at endemic levels prior to fire</li> <li>Populations have been cyclical with localized outbreaks associated with drought, windthrow, and fire</li> </ul>	<ul style="list-style-type: none"> <li>Increase in habitat for bark beetles, especially in fire-damaged trees</li> <li>Increase in habitat for wood borers in fire-killed trees</li> </ul>	<ul style="list-style-type: none"> <li>Increase in bark beetle populations due to retaining fire-damaged green trees</li> <li>Increase in wood borer populations due to retention of fire-killed trees</li> </ul>	<ul style="list-style-type: none"> <li>Fire-killed trees would be removed on approximately 6,000 acres of private industrial forest land reducing wood borer habitat on those acres.</li> </ul>	

Spread of Noxious Weeds	<ul style="list-style-type: none"> <li>• Occur along roads in forested areas</li> <li>• Increase open areas and disturbance increases risk of invasion and spread</li> </ul>	<ul style="list-style-type: none"> <li>• Increased risk of noxious weed establishment relative to disturbance and harvest systems</li> </ul>	<ul style="list-style-type: none"> <li>• Increased risk of noxious weed establishment offset by greater awareness and control measures</li> <li>• Reduced risk of spread due to reduced activities on LSR designated lands</li> <li>• Increased noxious weed treatments on private lands reduces potential for spread</li> </ul>	<ul style="list-style-type: none"> <li>• Reduced risk of spread due to implementation of mitigating measures, PDFs, and increased public awareness of noxious weed problems</li> </ul>
